## Authentication Protocol Domain Support

---

### Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting [iplg@microsoft.com](mailto:iplg@microsoft.com).
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit [www.microsoft.com/trademarks](http://www.microsoft.com/trademarks).
- **Fictitious Names.** The example companies, organizations, products, domain names, e-mail addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

**Reservation of Rights.** All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

**Tools.** The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

## Revision Summary

Date	Revision History	Revision Class	Comments
2/22/2007	0.1		Version 0.1 release
6/1/2007	2.0	Major	Updated and revised the technical content.
7/3/2007	3.0	Major	Added new protocol.
7/20/2007	3.0.1	Editorial	Changed language and formatting in the technical content.
8/10/2007	3.0.2	Editorial	Changed language and formatting in the technical content.
9/28/2007	4.0	Major	Updated and revised the technical content.
10/23/2007	4.0.1	Editorial	Changed language and formatting in the technical content.
11/30/2007	4.0.2	Editorial	Changed language and formatting in the technical content.
1/25/2008	4.0.3	Editorial	Changed language and formatting in the technical content.
3/14/2008	5.0	Major	Updated and revised the technical content.
5/16/2008	5.0.1	Editorial	Changed language and formatting in the technical content.
6/20/2008	6.0	Major	Updated and revised the technical content.
7/25/2008	7.0	Major	Updated and revised the technical content.
8/29/2008	7.0.1	Editorial	Changed language and formatting in the technical content.
10/24/2008	7.0.2	Editorial	Changed language and formatting in the technical content.
12/5/2008	8.0	Major	Updated and revised the technical content.
1/16/2009	9.0	Major	Updated and revised the technical content.
2/27/2009	9.1	Minor	Clarified the meaning of the technical content.
4/10/2009	10.0	Major	Updated and revised the technical content.
5/22/2009	11.0	Major	Updated and revised the technical content.
7/2/2009	12.0	Major	Updated and revised the technical content.
8/14/2009	13.0	Major	Updated and revised the technical content.
9/25/2009	14.0	Major	Updated and revised the technical content.
11/6/2009	15.0	Major	Updated and revised the technical content.
12/18/2009	16.0	Major	Updated and revised the technical content.
1/29/2010	17.0	Major	Updated and revised the technical content.
3/12/2010	17.0.1	Editorial	Changed language and formatting in the technical content.
4/23/2010	18.0	Major	Updated and revised the technical content.
6/4/2010	19.0	Major	Updated and revised the technical content.
7/16/2010	20.0	Major	Updated and revised the technical content.

<b>Date</b>	<b>Revision History</b>	<b>Revision Class</b>	<b>Comments</b>
8/27/2010	20.0	None	No changes to the meaning, language, or formatting of the technical content.
10/8/2010	21.0	Major	Updated and revised the technical content.
11/19/2010	21.1	Minor	Clarified the meaning of the technical content.
1/7/2011	21.1	None	No changes to the meaning, language, or formatting of the technical content.
2/11/2011	22.0	Major	Updated and revised the technical content.
3/25/2011	22.0	None	No changes to the meaning, language, or formatting of the technical content.
5/6/2011	23.0	Major	Updated and revised the technical content.
6/17/2011	23.1	Minor	Clarified the meaning of the technical content.
9/23/2011	23.1	None	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	24.0	Major	Updated and revised the technical content.
3/30/2012	24.0	None	No changes to the meaning, language, or formatting of the technical content.
7/12/2012	24.0	None	No changes to the meaning, language, or formatting of the technical content.
10/25/2012	25.0	Major	Updated and revised the technical content.
1/31/2013	25.1	Minor	Clarified the meaning of the technical content.
8/8/2013	26.0	Major	Updated and revised the technical content.
11/14/2013	26.1	Minor	Clarified the meaning of the technical content.
2/13/2014	27.0	Major	Updated and revised the technical content.
5/15/2014	28.0	Major	Updated and revised the technical content.
6/30/2015	29.0	Major	Significantly changed the technical content.
10/16/2015	30.0	Major	Significantly changed the technical content.

# 1 Introduction

Authentication Protocol Domain Support (APDS) provides the required communication between a server and a **domain controller (DC)** that uses Netlogon interfaces ([\[MS-NRPC\]](#) section 3.2) to complete an authentication sequence.

An operating system can support a number of authentication protocols, such as **NT LAN Manager (NTLM) Authentication Protocol**, **Kerberos**, **Secure Sockets Layer (SSL)/Transport Layer Security (TLS)**, and **Digest authentication**. Authentication Protocol Domain Support is used by NT LAN Manager (NTLM) and the **Digest validation** protocol to perform validation of the user's credentials at the domain controller. The Kerberos protocol uses Authentication Protocol Domain Support to perform the required communication for **privilege attribute certificate (PAC)** validation.

With the exception of Kerberos (which also relies on a mutually trusted third-party called **Key Distribution Center (KDC)** [\[MS-KILE\]](#)), all of these protocols can be supported by any server, relying only on a local user account database. Therefore, specifications for these protocols can stand entirely on their own. However, in a **domain** context, when the server is a member of a domain and relies on the **domain account** database, the domain controller contributes to the authentication and authorization processes.

Domain members use the Netlogon Remote Protocol [\[MS-NRPC\]](#) to communicate with the domain controller for purposes of authentication and authorization.

The implementations of these authentication protocols use a variety of methods to communicate with the domain controller in the course of their executions. These methods, collectively referred to as Authentication Protocol Domain Support, are specified in this document.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [\[RFC2119\]](#). Sections 1.5 and 1.9 are also normative but do not contain those terms. All other sections and examples in this specification are informative.

## 1.1 Glossary

The following terms are specific to this document:

**Active Directory:** A general-purpose network directory service. **Active Directory** also refers to the Windows implementation of a directory service. **Active Directory** stores information about a variety of objects in the network. Importantly, user accounts, computer accounts, groups, and all related credential information used by the Windows implementation of **Kerberos** are stored in **Active Directory**. **Active Directory** is either deployed as Active Directory Domain Services (AD DS) or Active Directory Lightweight Directory Services (AD LDS). [\[MS-ADTS\]](#) describes both forms. For more information, see [\[MS-AUTHSOD\]](#) section 1.1.1.5.2, Lightweight Directory Access Protocol (LDAP) versions 2 and 3, **Kerberos**, and DNS.

**APDS server:** The server side of Authentication Protocol Domain Support [\[MS-APDS\]](#), otherwise known as a **domain controller** in authentication protocols that use Authentication Protocol Domain Support.

**application server:** A computer that provides infrastructure and services for applications that are hosted on a server farm.

**Digest authentication:** A protocol that uses a challenge-response mechanism for authentication in which clients are able to verify their identities without sending an in-the-clear password to the server. For more information, see [\[RFC2617\]](#) and [\[RFC2831\]](#).

**Digest client:** The Digest Access Authentication: Microsoft Extensions [\[MS-DPSP\]](#) client.

**Digest server:** The server side of Digest Access Authentication: Microsoft Extensions [\[MS-DPSP\]](#).

**Digest validation:** A protocol to verify the **Digest authentication** challenge-response from a client to a server for a specified **domain** account.

**directory:** The database that stores information about objects such as users, groups, computers, printers, and the directory service that makes this information available to users and applications.

**domain:** A set of users and computers sharing a common namespace and management infrastructure. At least one computer member of the set must act as a **domain controller (DC)** and host a member list that identifies all members of the domain, as well as optionally hosting the **Active Directory** service. The domain controller provides authentication (2) of members, creating a unit of trust for its members. Each domain has an identifier that is shared among its members. For more information, see [MS-AUTHSOD] section 1.1.1.5 and [MS-ADTS].

**domain account:** A stored set of attributes (2) representing a principal used to authenticate a user or machine to an **Active Directory** domain.

**domain controller (DC):** The service, running on a server, that implements **Active Directory**, or the server hosting this service. The service hosts the data store for objects and interoperates with other **DCs** to ensure that a local change to an object replicates correctly across all **DCs**. When **Active Directory** is operating as Active Directory Domain Services (AD DS), the **DC** contains full NC replicas of the configuration naming context (config NC), schema naming context (schema NC), and one of the domain NCs in its forest. If the AD DS **DC** is a global catalog server (GC server), it contains partial NC replicas of the remaining domain NCs in its forest. For more information, see [MS-AUTHSOD] section 1.1.1.5.2 and [MS-ADTS]. When **Active Directory** is operating as Active Directory Lightweight Directory Services (AD LDS), several AD LDS **DCs** can run on one server. When **Active Directory** is operating as AD DS, only one AD DS **DC** can run on one server. However, several AD LDS **DCs** can coexist with one AD DS **DC** on one server. The AD LDS **DC** contains full NC replicas of the config NC and the schema NC in its forest. The domain controller is the server side of Authentication Protocol Domain Support [MS-APDS].

**domain name:** A **domain name** or a NetBIOS name that identifies a **domain**.

**interactive logon:** A software method in which the account information and credentials input by the user interactively are authenticated by a server or **domain controller (DC)**.

**Kerberos:** An authentication (2) system that enables two parties to exchange private information across an otherwise open network by assigning a unique key (called a ticket) to each user that logs on to the network and then embedding these tickets into messages sent by the users. For more information, see [MS-KILE].

**Key Distribution Center (KDC):** The **Kerberos** service that implements the authentication (2) and ticket granting services specified in the **Kerberos** protocol. The service runs on computers selected by the administrator of the **realm** or domain; it is not present on every machine on the network. It must have access to an account database for the **realm** that it serves. Windows **KDCs** are integrated into the **domain controller** role of a Windows Server operating system acting as a Domain Controller. It is a network service that supplies tickets to clients for use in authenticating to services.

**little-endian:** Multiple-byte values that are byte-ordered with the least significant byte stored in the memory location with the lowest address.

**machine account:** An account that is associated with individual client or server machines in an **Active Directory** domain.

**NetBIOS:** A particular network transport that is part of the LAN Manager protocol suite. **NetBIOS** uses a broadcast communication style that was applicable to early segmented local area networks. The LAN Manager protocols were the default in Windows NT operating system environments prior to Windows 2000 operating system. A protocol family including name

resolution, datagram, and connection services. For more information, see [\[RFC1001\]](#) and [\[RFC1002\]](#).

**network logon:** A software method in which the account information and credentials previously supplied by the user as part of an interactive logon are used again to log the user onto another network resource.

**NT LAN Manager (NTLM) Authentication Protocol:** A protocol using a challenge-response mechanism for authentication (2) in which clients are able to verify their identities without sending a password to the server. It consists of three messages, commonly referred to as Type 1 (negotiation), Type 2 (challenge) and Type 3 (authentication). For more information, see [\[MS-NLMP\]](#).

**NTLM client:** The NT LAN Manager (NTLM) Authentication Protocol [MS-NLMP] client.

**NTLM server:** The server side of NT LAN Manager (NTLM) Authentication Protocol [MS-NLMP].

**NTOWF:** A general-purpose function used in the context of an NTLM authentication protocol, as specified in [MS-NLMP], which computes a one-way function of the user's password. For more information, see [MS-NLMP] section 6. The result generated by the NTOWF() function.

**principal:** A unique entity identifiable by a security identifier (SID) that is typically the requester of access to securable objects or resources. It often corresponds to a human user but can also be a computer or service. It is sometimes referred to as a security principal.

**privilege attribute certificate (PAC):** A Microsoft-specific authorization data present in the authorization data field of a ticket. The **PAC** contains several logical components, including group membership data for authorization, alternate credentials for non-Kerberos authentication protocols, and policy control information for supporting interactive logon.

**realm:** An administrative boundary that uses one set of authentication servers to manage and deploy a single set of unique identifiers. A realm is a unique logon space.

**remote procedure call (RPC):** A context-dependent term commonly overloaded with three meanings. Note that much of the industry literature concerning RPC technologies uses this term interchangeably for any of the three meanings. Following are the three definitions: (\*) The runtime environment providing remote procedure call facilities. The preferred usage for this meaning is "RPC runtime". (\*) The pattern of request and response message exchange between two parties (typically, a client and a server). The preferred usage for this meaning is "RPC exchange". (\*) A single message from an exchange as defined in the previous definition. The preferred usage for this term is "RPC message". For more information about RPC, see [\[C706\]](#).

**RPC transport:** The underlying network services used by the remote procedure call (RPC) runtime for communications between network nodes. For more information, see [C706] section 2.

**Secure Sockets Layer (SSL):** A security protocol that supports confidentiality and integrity of messages in client and server applications that communicate over open networks. SSL uses two keys to encrypt data—a public key known to everyone and a private or secret key known only to the recipient of the message. SSL supports server and, optionally, client authentication (2) using X.509 certificates (2). For more information, see [\[X509\]](#). The SSL protocol is precursor to **Transport Layer Security (TLS)**. The TLS version 1.0 specification is based on SSL version 3.0 [\[SSL3\]](#).

**server computer:** The server role in the network topology of client/server/domain controller.

**service:** A process or agent that is available on the network, offering resources or services for clients. Examples of services include file servers, web servers, and so on.

**Transport Layer Security (TLS):** A security protocol that supports confidentiality and integrity of messages in client and server applications communicating over open networks. **TLS** supports

server and, optionally, client authentication by using X.509 certificates (as specified in [X509]). **TLS** is standardized in the IETF TLS working group. See [\[RFC4346\]](#).

**Unicode:** A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The **Unicode** standard [\[UNICODE5.0.0/2007\]](#) provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).

**user principal name (UPN):** A user account name (sometimes referred to as the user logon name) and a domain name that identifies the domain in which the user account is located. This is the standard usage for logging on to a Windows domain. The format is: someone@example.com (in the form of an email address). In **Active Directory**, the userPrincipalName attribute (2) of the account object, as described in [MS-ADTS].

**MAY, SHOULD, MUST, SHOULD NOT, MUST NOT:** These terms (in all caps) are used as defined in [\[RFC2119\]](#). All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

## 1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the [Errata](#).

### 1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com). We will assist you in finding the relevant information.

## 1.3 Overview

Authentication protocols such as NT LAN Manager (NTLM), Kerberos, Secure Sockets Layer (SSL)/Transport Layer Security (TLS), and Digest authentication are used by a variety of higher-layer protocols to provide security **services**.

The Authentication Protocol Domain Support Protocol specifies the communication between the server and the domain controller for each of the protocols.

Each of the protocols has a specific exchange with the domain controller (DC) as follows:

- Authenticating the client: NTLM and digest.
- Obtaining authorization information, such as group memberships: NTLM, digest, and SSL/TLS.
- Verifying the authorization information: The server operating system for Kerberos privilege attribute certificate (PAC) [\[MS-PAC\]](#).

All of these back-end, server-to-server protocols in turn use the Netlogon Remote Protocol [\[MS-NRPC\]](#) for their transport to the DC. Specifically, the protocols behave as follows:

- The NT LAN Manager (NTLM) Authentication Protocol [\[MS-NLMP\]](#) uses the Netlogon Remote Protocol [\[MS-NRPC\]](#) to communicate with the DC to complete the authentication of a domain account during an **interactive logon** or **network logon**. As user account information is maintained by the DC, only the DC can validate user credentials and complete the authentication

sequence. The server then uses the authorization information returned by the DC to make authorization decisions.

- The server operating system uses Netlogon generic pass-through ([MS-NRPC] section 3.2) to validate the PAC [MS-PAC] that it receives in the ticket from the client. Because PAC information can be altered by the server, the operating system may contact the DC to validate the PAC and ensure its integrity.
- The Digest Protocol Extensions [MS-DPSP] is used by deployments in which users are authenticated based on user name and password by using the Digest authentication mechanism. The Digest authentication mechanism itself defines how the client authenticates the user to the server (by proving knowledge of the password), and optionally provides integrity and confidentiality of subsequent messages exchanged between the client and the server. Digest validation is performed between the server and the DC during the initial client/server Digest-based authentication as follows:
  1. The server (which does not have access to the user's password) sends a Digest validation request (section 2.2.3.1) message to the domain controller by using the generic pass-through capability of the Netlogon Remote Protocol, as specified in [MS-NRPC] section 3.2.
  2. The DC looks up the user's password and uses it to verify the validity of the digest input. The digest input is originally generated by the **Digest client** using the user's password, as specified in [RFC2617] and [RFC2831].
  3. On successful validation, the domain controller returns the PAC in the [DIGEST\\_VALIDATION\\_RESP](#) message. The PAC represents the user's identity and group memberships, suitable for making authorization decisions.
- SSL/TLS and other protocols that authenticate users via the X.509 certificates [X509] can use the Remote Certificate Mapping Protocol [MS-RCMP], which relies on the generic pass-through capability of Netlogon to retrieve authorization information associated with users. This behavior is specified in [MS-RCMP].

## 1.4 Relationship to Other Protocols

Each of the following protocols relies on the Netlogon Remote Protocol ([MS-NRPC]) to complete the authentication sequence and retrieve or validate authorization information associated with a user. All higher-layer protocols that use one of the protocols specified in this document (for example, NT LAN Manager (NTLM) Authentication Protocol [MS-NLMP]) leverage the functionality specified here when in a domain environment.

### 1.4.1 NTLM Logon

NTLM authentication ([MS-NLMP]) uses the Netlogon pass-through authentication ([MS-NRPC] section 3.2) to authenticate the user in the domain with the domain controller during an interactive logon or a network logon.

### 1.4.2 Kerberos PAC Validation

The server operating system uses the Netlogon generic pass-through ([MS-NRPC] section 3.2.4.1) to validate the privilege attribute certificate (PAC) with the domain controller, when required.

### 1.4.3 Digest Validation Protocol

The Digest validation defined in this document relies on the generic pass-through capability of the Netlogon Remote Protocol ([MS-NRPC] section 3.2.4.1) as a transport for the

[DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) and [DIGEST\\_VALIDATION\\_RESP \(section 2.2.3.2\)](#) messages.

## 1.5 Prerequisites/Preconditions

Each of the protocols in this specification relies on the Netlogon Remote Protocol [\[MS-NRPC\]](#). [MS-NRPC] assumes that the following prerequisites are met:

- The server has a **machine account** in the domain.
- The server has established a secure connection with the domain controller (DC).

### 1.5.1 NTLM Logon

NTLM interactive logon and NTLM network logon have all of the prerequisites and preconditions that are defined in the NT LAN Manager (NTLM) Authentication Protocol [\[MS-NLMP\]](#).

### 1.5.2 Kerberos PAC Validation

Kerberos PAC validation assumes that the server operating system has a PAC that has been received in a ticket from the client to the **application server**. It is possible for a server operating system to require PAC validation (section [1.6.2](#)).

### 1.5.3 Digest Validation Protocol

The Digest validation protocol assumes the following:

- The DC server has access to the user's password.
- The Digest client possesses the digest-response message ([\[RFC2617\]](#) section 3.2.2) and the initial digest-challenge message ([\[RFC2617\]](#) section 3.2.1) used in the Digest authentication protocol.

## 1.6 Applicability Statement

All protocol support for domains requires a domain authority to process the requests. These protocols are not applicable to any stand-alone machine that is not associated with a domain. Each protocol has additional applicability constraints.

### 1.6.1 NTLM Logon

NTLM ([\[MS-NLMP\]](#) section 1.6) also applies when the **NTLM server** performing the NTLM authentication is a member of a domain. Both NTLM for interactive logon and NTLM for network logon can be performed by using a domain controller (DC).<1>

### 1.6.2 Kerberos PAC Validation

**Figure 1: Kerberos PAC validation**

Before Kerberos PAC validation occurs, the client has sent the privilege attribute certificate (PAC) to the service as a part of the Kerberos Protocol Extensions described in [\[MS-KILE\]](#). The operating system on which the service runs validates the PAC to prevent PAC tampering by the service. PAC tampering can result in inappropriate elevation of privileges.

PAC validation is applicable for Kerberos applications that process and interpret the PAC and present that authorization data to additional services. It is optional for a self-contained application because the security threat that the protocol addresses is not relevant for self-contained applications. [<2>](#)

### **1.6.3 Digest Validation Protocol**

The Digest validation protocol is appropriate for servers that are implementing Digest authentication and are acting as members in an **Active Directory**-compatible domain.

## **1.7 Versioning and Capability Negotiation**

### **1.7.1 NTLM Logon**

NTLM interactive logon and network logon do not have any versioning or capability negotiation.

### **1.7.2 Kerberos PAC Validation**

Kerberos PAC validation does not have any versioning or capability negotiation.

### **1.7.3 Digest Validation Protocol**

The [DIGEST\\_VALIDATION\\_REQ](#) and [DIGEST\\_VALIDATION\\_RESP](#) messages have a dedicated version number field. This document defines version 1 of the Digest validation protocol. The Digest validation protocol does not support any capability negotiation.

## **1.8 Vendor-Extensible Fields**

### **1.8.1 NTLM Logon**

NTLM interactive logon and network logon do not have any vendor-extensible fields.

### **1.8.2 Kerberos PAC Validation**

Kerberos PAC validation does not have any vendor-extensible fields.

### **1.8.3 Digest Validation Protocol**

The Digest validation protocol does not have any vendor-extensible fields. Note that the Digest validation protocol has reserved fields for future use, but these fields are not intended to carry opaque or vendor-defined data.

## **1.9 Standards Assignments**

None.

## 2 Messages

### 2.1 Transport

Domain support for implementations of the Authentication Protocol Domain Support protocol SHOULD use Netlogon **remote procedure call (RPC)** messages in the logon interface. The Netlogon **RPC transport** is specified in [\[MS-NRPC\]](#).

### 2.2 Message Syntax

For domain support, authentication protocols MUST use an NRPC pass-through authentication ([\[MS-NRPC\]](#) section 3.2) method with parameters determined by the authentication protocol being used.

Interactive and network logon information, passed through the *LogonInformation* parameter, is used when calling the NtLogonSamLogonEx method ([\[MS-NRPC\]](#) section 3.5.4.5.1). Domain controller Kerberos PAC validation and digest messages MUST be encoded as opaque blobs and transported by the generic pass-through capability of Netlogon ([\[MS-NRPC\]](#) section 3.2.4.1).

All message fields, including bit flags, are in the following sections in **little-endian** format. These data structures MUST be built as if they are on a little-endian machine before transmission. On reception, the messages MUST be interpreted as little-endian and transformed into the native endianness of the implementation.

The following table shows a few of the main status codes returned by these protocols. For a complete list of status codes, see [\[MS-ERREF\]](#).

Symbolic name	Value	Meaning
STATUS_SUCCESS	0x00000000	Requested operation succeeded.
STATUS_LOGON_FAILURE	0xC000006D	Authentication failed.
STATUS_NO_SUCH_USER	0xC0000064	Specified account does not exist.
STATUS_NO_LOGON_SERVERS	0xC000005E	None of the domain controllers are reachable to service the request.

#### 2.2.1 NTLM Logon Message Syntax

The specific message syntax for NTLM interactive logon or network logon is part of the NRPC pass-through authentication ([\[MS-NRPC\]](#) section 3.2). The domain support for NTLM logon is invoked by calling an NRPC pass-through authentication ([\[MS-NRPC\]](#) section 3.2) method.

#### 2.2.2 Kerberos PAC Validation Message Syntax

The privilege attribute certificate (PAC) validation request message, [KERB\\_VERIFY\\_PAC\\_REQUEST](#) (section 2.2.2.1), MUST be encoded as a contiguous buffer. The encoded data SHOULD be sent by using the generic pass-through mechanism ([\[MS-NRPC\]](#) section 3.2.4.1). The encoding of the [KERB\\_VERIFY\\_PAC\\_REQUEST](#) is specified in section 2.2.2.1.

##### 2.2.2.1 KERB\_VERIFY\_PAC\_REQUEST Message

The following diagram shows the format of the message used for PAC validation.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
MessageType																															
ChecksumLength																															
SignatureType																															
SignatureLength																															
ChecksumAndSignature (variable)																															
...																															

**MessageType (4 bytes):** An unsigned 32-bit value describing the message type. This member MUST be set to 0x00000003.

**ChecksumLength (4 bytes):** An unsigned 32-bit value that MUST contain the signature length of the PAC\_SIGNATURE\_DATA Signature value ([MS-PAC] section 2.8) for the Server Signature ([MS-PAC] section 2.8.1) in the privilege attribute certificate (PAC).

**SignatureType (4 bytes):** An unsigned 32-bit value that MUST contain the PAC\_SIGNATURE\_DATA SignatureType value ([MS-PAC] section 2.8) for the Key Distribution Center (KDC) Signature ([MS-PAC] section 2.8.1) in the PAC.

**SignatureLength (4 bytes):** An unsigned 32-bit value that MUST contain the signature length of the PAC\_SIGNATURE\_DATA Signature value ([MS-PAC] section 2.8) in the KDC Signature ([MS-PAC] section 2.8.1) in the PAC.

**ChecksumAndSignature (variable):** The PAC\_SIGNATURE\_DATA Signature value ([MS-PAC] section 2.8) for the Server Signature ([MS-PAC] section 2.8.1) in the PAC. It MUST be followed by the PAC\_SIGNATURE\_DATA Signature value ([MS-PAC] section 2.8) for the KDC Signature ([MS-PAC] section 2.8.1) in the PAC.

### 2.2.3 Digest Validation Message Syntax

The Digest validation protocol uses fields extracted from the digest-challenge and digest-response messages ([RFC2617] section 3.2 and [RFC2831] section 2.1) to verify the validity of the user signature (this is a hash performed with the user's password) and to retrieve the PAC for the user's account.

#### 2.2.3.1 DIGEST\_VALIDATION\_REQ Message

The **DIGEST\_VALIDATION\_REQ** message defines a request to validate the input from the Digest Protocol Extensions [MS-DPSP] and retrieve user authorization information.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
MessageType																															
Version																MsgSize															

DigestType	QopType
AlgType	CharsetType
CharValuesLength	NameFormat
Flags	AccountNameLength
DomainLength	ServerNameLength
Reserved3	Reserved4
Pad1	
...	
Payload (variable)	
...	

**MessageType (4 bytes):** A 32-bit unsigned integer that defines the Digest validation message type. This member MUST be set to 0x0000001A.

**Version (2 bytes):** A 16-bit unsigned integer that defines the version of the Digest validation protocol. The protocol version defined in this document is 1 (the value of this member MUST be 0x0001).

**MsgSize (2 bytes):** A 16-bit unsigned integer that MUST specify the total number of bytes in the DIGEST\_VALIDATION\_REQ message (2.2.3.1).

**DigestType (2 bytes):** A 16-bit unsigned integer that specifies the Digest protocol used, which MUST be one of the following:

Value	Meaning
0x0003	Using the Digest authentication mechanism <a href="#">[RFC2617]</a> for the HTTP/1.1 Protocol.
0x0004	Using Digest authentication as a Simple Authentication and Security Layer (SASL) mechanism <a href="#">[RFC2831]</a> .

**QopType (2 bytes):** A 16-bit unsigned integer specifying the Quality of Protection (QoP) requested by the Digest client ([RFC2617] section 3.2.1 and [RFC2831] section 2.1.2.1) that MUST be one of the following:

Value	Meaning
0x0001	The Digest client did not specify a QoP. For backward compatibility with Digest Access authentication <a href="#">[RFC2069]</a> , Digest authentication ([RFC2617] made the QoP optional).
0x0002	Authentication only. Represents auth ([RFC2617] section 3.2.1 and [RFC2831] section 2.1.1).
0x0003	Authentication and integrity protection. Represents auth-int ([RFC2617] section

Value	Meaning
	3.2.1 and [RFC2831] section 2.1.1).
0x0004	Authentication with integrity protection and encryption. Represents auth-conf ([RFC2831] section 2.1.1).

**AlgType (2 bytes):** A 16-bit unsigned integer specifying the algorithm value specified by the Digest client in the digest-challenge message ([RFC2617] section 3.2.1) that MUST be one of the following values:

Value	Meaning
0x0001	MD5 assumed; the algorithm was not present ([RFC2617] section 3.2.1).
0x0002	MD5 value to produce the digest and checksum ([RFC2617] section 2.1.1).
0x0003	MD5-sess value to produce the digest and checksum ([RFC2617] section 3.2.1 and [RFC2831] section 2.1.1).

**CharsetType (2 bytes):** A 16-bit unsigned integer specifying the type of encoding used for **username** and **password** fields that MUST be one of the following (as specified in [RFC2831] section 2.1.1 and [MS-DPSP] section 2.2):

Value	Meaning
0x0001	ISO8859-1 encoding is used for <b>username</b> and <b>password</b> fields.
0x0002	UTF-8 encoding is used for <b>username</b> and <b>password</b> fields.

**CharValuesLength (2 bytes):** A 16-bit unsigned integer that MUST specify the number of bytes in the **Payload** field of the DIGEST\_VALIDATION\_REQ message, and MUST NOT exceed the total size in MsgSize.

**NameFormat (2 bytes):** A 16-bit unsigned integer specifying the format of the user **AccountName** field (in the DIGEST\_VALIDATION\_REQ message), and MUST be one of the following:

Value	Meaning
0x0000	<b>Digest server</b> cannot determine the format of the user's <b>AccountName</b> .
0x0001	A format determined to be the SAM account name ([MS-ADA3] 2.222).
0x0002	A format determined to be the <b>user principal name (UPN)</b> for the account ([MS-ADA3] 2.222).
0x0003	A format determined to be <b>NetBIOS</b> ([MS-ADA3] 2.4).

**Flags (2 bytes):** A two-byte set of bit flags providing additional instructions for processing the DIGEST\_VALIDATION\_REQ message (section 2.2.3.1) by the DC. The **Flags** field is constructed from one or more bit flags from the following table, with the exception of the constraint on bit C.

**Note** All other bits MUST be set to zero and MUST be ignored upon receipt.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	0	0	0	0	0	0	0	0	0	0	E	D	C	B	A

Where the bits are defined as:

Value	Description
A	The format of <b>Username</b> and <b>Realm</b> (carried in the <b>Payload</b> field of DIGEST_VALIDATION_REQ) MUST be determined by the DC.
B	The optional <b>Authzid</b> field ([RFC2831] section 2.1.2) is set and carried in the Payload buffer in the DIGEST_VALIDATION_REQ message (section 2.2.3.1).

Value	Description
C	Indicates that this request is from a server, so group memberships are to be expanded for the Account's PAC. This bit MUST NOT be set if this request is forwarded from a server's domain to user account's domain.
D	Indicates if a single backslash is found in the username value ([RFC2617] section 3.2.2).
E	Indicates the DC will attempt to validate the request with an un-escaped backslash ([MS-DPSP] section 2.2).

**AccountNameLength (2 bytes):** A 16-bit unsigned integer that MUST specify the length of the **AccountName** field in the Payload buffer.

**DomainLength (2 bytes):** A 16-bit unsigned integer that MUST specify the length of the Domain field in the Payload buffer.

**ServerNameLength (2 bytes):** A 16-bit unsigned integer that MUST specify the length of the **ServerName** field in the Payload buffer.

**Reserved3 (2 bytes):** A 16-bit unsigned integer field reserved for future use. MUST be set to zero when sent and MUST be ignored on receipt.

**Reserved4 (2 bytes):** A 16-bit unsigned integer field reserved for future use. MUST be set to zero when sent and MUST be ignored on receipt.

**Pad1 (8 bytes):** An unused, 64-bit unsigned integer. MUST be set to zero when sent and MUST be ignored on receipt.

**Payload (variable):** A byte array that MUST contain the following strings in the following order. All strings are the unquoted directive value. All strings MUST be null-terminated; strings MUST be encoded by using [\[ISO/IEC-8859-1\]](#), unless specified as **Unicode**. Each of the strings MUST be included. If the string value is empty, then a terminating null character MUST be used for the value. Remember that the last three strings are Unicode strings, so they have a Unicode terminating null character.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Username (variable)

...	
AccountName (variable)	
...	Domain (variable)
...	
...	ServerName (variable)
...	
...	

**Username (variable):** The user name value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.2.

**Realm (variable):** The **realm** value that MUST be as specified in [RFC2617] section 3.2.1.

**Nonce (variable):** The nonce value from the digest-challenge message that MUST be as specified in [RFC2617] section 3.2.1.

**CNonce (variable):** The cnonce value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.2.

**NonceCount (variable):** The nc-value from the digest-response message, that MUST be as specified in [RFC2617], section 3.2.2.

**Algorithm (variable):** The algorithm value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.1.

**QOP (variable):** The QOP value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.2.

**Method (variable):** Method by which Digest authentication information MUST be transmitted as part of the HTTP1.1 protocol. The string value is GET or PUT if Digest authentication is used for the HTTP1.1 protocol [RFC2617]. The string value is AUTHENTICATE if Digest authentication is used as an SASL mechanism [RFC2617].

**URI (variable):** The digest-URI value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.2.

**Response (variable):** The response value from the digest-response message that MUST be as specified in [RFC2617] section 3.2.2.

**Hentity (variable):** The H (entity-body) value that MUST be as specified in [RFC2617] section 3.2.2.3.

**Authzid (variable):** The Authzid value from the digest-response message that MUST be as specified in [RFC2831] section 2.1.2.

**AccountName (variable):** A Unicode string that MUST specify the user account name.

**Domain (variable):** A Unicode string that MUST specify the domain to which the user account belongs.

**ServerName (variable):** A Unicode string that MUST specify the NetBIOS name of the server that sent the DIGEST\_VALIDATION\_REQ message (section 2.2.3.1).

### 2.2.3.2 DIGEST\_VALIDATION\_RESP Message

The DIGEST\_VALIDATION\_RESP message is a response to a [DIGEST\\_VALIDATION\\_REQ](#) message.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1

AuthData (variable)	
...	
AccountName (variable)	
...	

**MessageType (4 bytes):** A 32-bit unsigned integer that MUST specify the Digest validation message type. This member MUST be 0x0000000A.

**Version (2 bytes):** A 16-bit unsigned integer that MUST specify the version of the Digest validation protocol. The protocol version defined in this document is 1. The value of this member MUST be 0x0001.

**Pad2 (2 bytes):** An unused 16-bit unsigned integer. MUST be set to zero when sent and MUST be ignored on receipt.

**Status (4 bytes):** A 32-bit unsigned integer specifying if the Digest authentication data sent in the DIGEST\_VALIDATION\_REQ (section 2.2.3.1) was successfully verified by the domain controller. On successful validation, the **Status** field MUST be set to STATUS\_SUCCESS. On failure, it MUST be set to STATUS\_LOGON\_FAILURE. Both values are as specified in [\[MS-ERREF\]](#) section 2.3.

**SessionKeyLength (2 bytes):** A 16-bit unsigned integer that MUST specify the number of bytes of the **SessionKey** field in the DIGEST\_VALIDATION\_RESP message (section 2.2.3.2) plus a terminating null character. It MUST be equal to 33.

**Pad3 (2 bytes):** An unused 16-bit unsigned integer. MUST be set to zero when sent and MUST be ignored on receipt.

**AuthDataSize (4 bytes):** A 32-bit unsigned integer that MUST specify the number of bytes of the **AuthData** field in the DIGEST\_VALIDATION\_RESP message (section 2.2.3.2).

**AcctNameSize (2 bytes):** A 16-bit unsigned integer that MUST specify the number of bytes of the **AccountName** field in the DIGEST\_VALIDATION\_RESP message (section 2.2.3.2).

**Reserved1 (2 bytes):** A 16-bit unsigned integer field reserved for future use. MUST be set to zero when sent and MUST be ignored on receipt.

**MessageSize (4 bytes):** A 32-bit unsigned integer that MUST specify the number of bytes in the entire DIGEST\_VALIDATION\_RESP message (section 2.2.3.2).

**Reserved3 (4 bytes):** A 32-bit unsigned integer field reserved for future use. MUST be set to zero when sent and MUST be ignored on receipt.

**SessionKey (32 bytes):** A 32-byte buffer that MUST contain the Digest SessionKey ([\[RFC2617\]](#) section 3.2.2.2).

**SessionKey NULL terminator (1 byte):** A single byte to terminate the SessionKey. MUST be set to zero.

**Pad4 (7 bytes):** An unused 7-byte padding. The value of each byte MUST be set to zero when sent and MUST be ignored on receipt.

**Pad1 (8 bytes):** An unused 64-bit unsigned integer. MUST be set to zero when sent and MUST be ignored on receipt.

**AuthData (variable):** The **AuthData** field MUST contain a PACTYPE structure ([\[MS-PAC\]](#) section 2.3). The length of the PACTYPE structure MUST be specified by the **AuthDataSize** field. The length of this field MUST be 0 if the value of the **Status** field is STATUS\_LOGON\_FAILURE.

**AccountName (variable):** The **AccountName** field MUST contain the NetBIOS name of the user's account. The length of **AccountName** MUST be specified by the **AcctNameSize** field.

## 3 Protocol Details

Authentication Protocol Domain Support (specified for each of the protocols in the following sections) uses NRPC [\[MS-NRPC\]](#) for transport. Each of the following protocols is a simple request-response exchange over this transport. The security assurances provided by the underlying Netlogon and RPC protocols are common to all of these protocols. All of these exchanges require that a remote procedure call (RPC) connection through the Netlogon secure channel MUST be established with a domain controller (DC) for the domain to which the server belongs (section [1.5](#)).

### 3.1 NTLM Logon Details

NT LAN Manager (NTLM) interactive logon and network logon MUST complete the authentication sequence by contacting the DC using an NRPC pass-through authentication ([\[MS-NRPC\]](#) section 3.2) method, with parameters as specified in section [3.1.5](#).

The NETLOGON\_NETWORK\_INFO and NETLOGON\_VALIDATION\_SAM\_INFO4 data structures SHOULD be exchanged ([\[MS-NRPC\]](#) sections 2.2.1.4.5 and 2.2.1.4.13). The DC MUST populate the NETLOGON\_VALIDATION\_SAM\_INFO4 with the information for the user logging on and return the SessionBaseKey ([\[MS-NLMP\]](#) section 3.3.1 and 3.3.2) in the **UserSessionKey** field in NETLOGON\_VALIDATION\_SAM\_INFO4, and MUST send it back to the NTLM server. If no matching account is found, an error STATUS\_NO\_SUCH\_USER (section [2.2](#)) MUST be returned to the NTLM server, resulting in a logon failure.

#### 3.1.1 Abstract Data Model

The protocol requires that the DC MUST have a database or **directory** of accounts with authorization information available to it.

The NTLM abstract data model is specified in [\[MS-NLMP\]](#) section 3.1.1. The Netlogon abstract data model is specified in [\[MS-NRPC\]](#) section 3.1.1.

The NTLM server uses the following configuration values: [<3>](#)

**LogonAttempts:** A 32-bit unsigned integer that contains the total number of logon attempts since the last restart.

**NTLMServerDomainBlocked:** A Boolean setting that controls the NTLM server responding to NTLM authentication requests. When set to TRUE, this setting disables the NTLM server from sending NTLM pass-through authentication messages (section [3.1.5](#)) to any DC. [<4>](#)

For NTLM server implementations that use an authorization model that is based on a security identifier (SID), the server maintains the following parameter for each security context:

**ImpersonationAccessToken (Public):** A Token/Authorization Context (see [\[MS-DTYP\]](#) section 2.5.2).

The DC uses the following configuration values:

**AccountDCBlocked:** A Boolean setting that controls the DC responding to NTLM authentication requests. When set to TRUE, this setting disables the account domain DC from responding to NTLM pass-through authentication messages (section 3.1.5). [<5>](#)

**ResourceDCBlocked:** A Boolean setting controls the DC responding to NTLM authentication requests. When set to TRUE, this setting disables the resource domain DC from sending NTLM pass-through authentication messages (section 3.1.5). [<6>](#)

**DCBlockExceptions:** A list of server names that can use NTLM authentication. [<7>](#)

### 3.1.2 Timers

None.

### 3.1.3 Initialization

The **LogonAttempts** field SHOULD be initialized to zero on startup.

### 3.1.4 Higher-Layer Triggered Events

The NTLM logon message exchange MUST be triggered by a server requesting user authentication via the Netlogon remote procedure call (RPC) mechanism to the domain controller (DC).

### 3.1.5 Message Processing Events and Sequencing Rules

NTLM logon is a stateless protocol with request-response semantics.

The NTLM server SHOULD call the NetrLogonSamLogonEx method [<8>](#) ([MS-NRPC] section 3.5.4.5.1) with the parameters defined in the following sections. Based on the account name supplied, a domain controller (DC) for the domain MUST be located ([MS-ADTS] section 6.3.6). The NTLM server MUST establish a connection with the DC ([MS-NRPC] section 3.1.4.6). The NTLM server SHOULD invoke the NetrLogonSamLogonEx method ([MS-NRPC] section 3.5.4.5.1). [<9>](#)

If **NTLMServerDomainBlocked** == TRUE, then the NTLM server MUST return STATUS\_NTLM\_BLOCKED to the **NTLM client**. [<10>](#)

If the DC is of the resource domain,

- If **ResourceDCBlocked** == TRUE, and the NTLM server's name is not equal to any of the **DCBlockExceptions** server names, then the DC MUST return STATUS\_NTLM\_BLOCKED. [<11>](#)

If the DC is of the account domain,

- If **AccountDCBlocked** == TRUE, then the **APDS server** MUST return STATUS\_NTLM\_BLOCKED. [<12>](#)
- If the domainControllerFunctionality attribute ([MS-ADTS] section 3.1.1.3.2.25) returns a value that is >= 6, the account is not also the NTLM server's account, and the APDS server determines that an authentication policy setting ([MS-KILE] section 3.3.5.5) applies, then:
  - If the account is:
    - A user account object, and the corresponding msDS-UserAllowedToAuthenticateFrom ([MS-ADA2] section 2.473) is populated, then the APDS MUST return STATUS\_ACCOUNT\_RESTRICTION. [<13>](#)
    - A managed Service account object, and the corresponding msDS-ServiceAllowedToAuthenticateFrom ([MS-ADA2] section 2.447) is populated, then the APDS MUST return STATUS\_ACCOUNT\_RESTRICTION. [<14>](#)
    - If AllowedToAuthenticateTo is not NULL, an access check is performed to determine whether the user has the ACTRL\_DS\_CONTROL\_ACCESS right against the AllowedToAuthenticateTo. If the access check fails the APDS MUST return STATUS\_AUTHENTICATION\_FIREWALL\_FAILED. [<15>](#)

The DC MUST verify the account access status. If the account is not valid for logon, the APDS server will return one of the following errors:

- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) D flag is set to TRUE, the APDS server SHOULD return STATUS\_ACCOUNT\_DISABLED.
- If the AccountExpires attribute ([\[MS-ADA1\]](#) section 2.1) is set to a value that is in the past, the APDS server SHOULD return STATUS\_ACCOUNT\_EXPIRED.
- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) L flag is set to TRUE, the APDS server SHOULD return STATUS\_ACCOUNT\_LOCKED\_OUT.
- If the current time is not within logonHours attribute ([MS-ADA1] section 2.376), the APDS server SHOULD return STATUS\_INVALID\_LOGON\_HOURS.
- If PasswordMustChange, which is generated with the same method as the SAM ([\[MS-SAMR\]](#) section 3.1.5.14.4), is set to a value that is in the past, then the APDS server SHOULD return STATUS\_PASSWORD\_EXPIRED.
- If PasswordMustChange, which is generated with the same method as the SAM ([MS-SAMR] section 3.1.5.14.4), is zero, then the APDS server SHOULD return STATUS\_PASSWORD\_MUST\_CHANGE.
- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) SR flag is set to TRUE, because this is a password-based logon, the APDS server SHOULD return STATUS\_SMARTCARD\_LOGON\_REQUIRED.
- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) ID flag is set to TRUE, the APDS server SHOULD return STATUS\_NOLOGON\_INTERDOMAIN\_TRUST\_ACCOUNT.
- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) WT flag is set to TRUE, the APDS server SHOULD return STATUS\_NOLOGON\_WORKSTATION\_TRUST\_ACCOUNT.
- If the userAccountControl attribute ([MS-ADTS] section 2.2.16) ST flag is set to TRUE, the APDS server SHOULD return STATUS\_NOLOGON\_SERVER\_TRUST\_ACCOUNT.

An APDS server implementation MAY choose to send more descriptive error codes (as in the case above). However, the NTLM server MUST treat any error returned by the DC as a logon failure.

The DC SHOULD attempt to validate the request, increment **LogonAttempts**, and if successful, SHOULD proceed to authenticate the user. If validation is unsuccessful, the DC MUST return an error. The role of the DC in the NTLM authentication sequence is specified in [\[MS-NLMP\]](#) section 3.3.

Upon successful validation,

- If the domainControllerFunctionality attribute ([MS-ADTS] section 3.1.1.3.2.25) returns a value that is  $\geq 6$  and the user is a member of PROTECTED\_USERS ([MS-DTYP] section 2.4.2.4), then the APDS MUST return STATUS\_ACCOUNT\_RESTRICTION. [<16>](#)
- Otherwise, the user account's DC MUST send the domain global groups and universal groups (that the user is a member of) to the server's DC, and MUST follow the trust path that was used to contact the user's account DC ([MS-NRPC] section 3.5.4.5.1).

When the trust crossed in the trust path has the TRUST\_ATTRIBUTE\_CROSS\_ORGANIZATION ([\[MS-LSAD\]](#) section 2.2.7.9) set, the DC MUST add the OTHER\_ORGANIZATION\_SID ([\[MS-DTYP\]](#) Section 2.4.2.4) to the user's groups.

When a user has the OTHER\_ORGANIZATION\_SID, the server domain DC MUST perform an access check where:

- The security descriptor MUST contain the ACL granting the client user `CTRL_DS_CONTROL_ACCESS` ([MS-SAMR] section 2.2.1.17) to the **server computer's** AD account object.

If the access check fails, the DC MUST reject the authentication request and return STATUS\_AUTHENTICATION\_FIREWALL\_FAILED. The server domain DC also MUST add the domain local groups, and then send the entire list of groups to the NTLM server to be used for authorization decisions.

For NTLM server implementations that use an authorization model that is based on a security identifier (SID), the server SHOULD populate the User SID and Security Group SIDs in the **ImpersonationAccessToken** (section [3.1.1](#)) as follows:

- Concatenate **LogonDomainId** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13) and **UserId** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13), add the result to the **ImpersonationAccessToken.Sids** array, and set the **ImpersonationAccessToken.UserIndex** field to this index.
- Concatenate **LogonDomainId** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13) and **PrimaryGroupId** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13), add the result to the **ImpersonationAccessToken.Sids** array, and set the **ImpersonationAccessToken.PrimaryGroup** field to this index.
- For each **GroupIds** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13), concatenate **LogonDomainId** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13) and **GroupIds.RelativeID** ([MS-NRPC] sections 2.2.1.4.11, 2.2.1.4.12, and 2.2.1.4.13), and add the result to the **ImpersonationAccessToken.Sids** array.
- For each **ExtraSids** ([MS-NRPC] sections 2.2.1.4.12 and 2.2.1.4.13), add the **ExtraSids.Sid** ([MS-NRPC] sections 2.2.1.4.12 and 2.2.1.4.13) to the **ImpersonationAccessToken.Sids** array.

The server SHOULD call GatherGroupMembershipForSystem ([MS-DTYP] section 2.5.2.1.1), where **InitialMembership** contains the **ImpersonationAccessToken.Sids** array, and set the **ImpersonationAccessToken.Sids** array to **FinalMembership**.

The server SHOULD call AddPrivilegesToToken ([MS-DTYP] section 2.5.2.1.2), where **Token** contains **ImpersonationAccessToken**.

Other SID structures may be added to **ImpersonationAccessToken** following authentication (see [MS-DTYP] section 2.7.1).

### 3.1.5.1 NTLM Interactive Logon

For NTLM interactive logons, the NTLM server SHOULD call NetrLogonSamLogonEx ([MS-NRPC] section 3.5.4.5.1) [<17>](#) with the following parameters (set as specified):

- LogonLevel MUST be NetlogonInteractiveInformation.
- IF the G flag in NegotiateFlags ([MS-NRPC] section 3.1.4.2) is set to FALSE, the ValidationLevel MUST be NetlogonValidationSamInfo ([MS-NRPC] section 2.2.1.4.17).  
  
ELSE IF the Y or T flags are set to FALSE in NegotiateFlags ([MS-NRPC] Section 3.1.4.2), the ValidationLevel MUST be NetlogonValidationSamInfo2 ([MS-NRPC] section 2.2.1.4.17).  
  
ENDIF.
- IF SealSecureChannel ([MS-NRPC] Section 3.1.1) is set to FALSE, then the ValidationLevel MUST be NetlogonValidationSamInfo2 ([MS-NRPC] section 2.2.1.4.17).  
  
ELSE the ValidationLevel SHOULD be NetlogonValidationSamInfo4 ([MS-NRPC] section 2.2.1.4.17). [<18>](#)  
  
ENDIF.

- LogonInformation MUST contain a reference to NETLOGON\_INTERACTIVE\_INFO ([MS-NRPC] section 2.2.1.4.3).

The logon request MUST be sent to the domain controller of the user account domain that has been located.

If the domain controller for the user account is not reachable, but the user domain is one of the trusted domains, the logon MUST fail. If the user domain is not one of the trusted domains, the NTLM server's local account database MUST be used to authenticate the user.

The request that is sent to the user account domain controller MUST contain the **NTOWF** of the user's password.

The domain controller MUST verify the response to the challenge ([MS-NLMP] section 3.3). If there is a successful match, the domain controller MUST return data with ValidationInformation containing a reference to:

- NETLOGON\_VALIDATION\_SAM\_INFO4 ([MS-NRPC] section 2.2.1.4.13), if the ValidationLevel in the request is NetlogonValidationSamInfo4.
- NETLOGON\_VALIDATION\_SAM\_INFO2 ([MS-NRPC] section 2.2.1.4.12), if the ValidationLevel in the request is NetlogonValidationSamInfo2.
- NETLOGON\_VALIDATION\_SAM\_INFO ([MS-NRPC] section 2.2.1.4.11), if the ValidationLevel in the request is NetlogonValidationSamInfo.

If there is not a match, the DC MUST return the failure error code STATUS\_WRONG\_PASSWORD (section 2.2) with no response data. <19>

### 3.1.5.2 NTLM Network Logon

For NTLM network logons, the NTLM server SHOULD call NetrLogonSamLogonEx ([MS-NRPC] section 3.5.4.5.1) <20> with the following parameters (set as specified):

- LogonLevel MUST be NetlogonNetworkInformation.
- IF the G flag in NegotiateFlags ([MS-NRPC] section 3.1.4.2) is set to FALSE, the ValidationLevel MUST be NetlogonValidationSamInfo ([MS-NRPC] section 2.2.1.4.17).  
ELSE IF the Y or T flags in NegotiateFlags ([MS-NRPC] section 3.1.4.2) are set to FALSE, the ValidationLevel MUST be NetlogonValidationSamInfo2 ([MS-NRPC] section 2.2.1.4.17).  
ENDIF.
- IF SealSecureChannel ([MS-NRPC] section 3.1.1) is set to FALSE, then the ValidationLevel MUST be NetlogonValidationSamInfo2 ([MS-NRPC] section 2.2.1.4.17).  
ELSE the ValidationLevel SHOULD be NetlogonValidationSamInfo4 ([MS-NRPC] section 2.2.1.4.17). <21>  
ENDIF.
- LogonInformation MUST contain a reference to NETLOGON\_NETWORK\_INFO ([MS-NRPC] section 2.2.1.4.5).
- Set the **E** and **K** bits of **LogonInformation.LogonNetwork.Identity.ParameterControl**. <22>
- The following algorithm is used for authentication from the server to the DC:  
**IF** (NTLMSSP\_NEGOTIATE\_ENHANCED\_SESSION\_SECURITY and NtResponseLength == 24 and LmResponseLength >= 8)

- NetlogonNetworkInformation.LmChallenge = MD5(Concatenate(ChallengeToClient, LmResponse[0..7]))[0..7]

ELSE

- NetlogonNetworkInformation.LmChallenge = ChallengeToClient

END

The DC of the server's domain MUST be located ([MS-NRPC] section 3.5.4.3) and the request sent to it. This request MUST contain the NTLM challenge-response pair that was exchanged between the NTLM server and the client ([MS-NLMP] sections 2.2.1.2 and 2.2.1.3).

The DC MUST verify the response to the challenge ([MS-NLMP] section 3.3) or by means of a sub-authentication package (section [3.1.5.2.1](#)).

If the account is a computer account, the sub-authentication package is not verified, and the **K** bit of **LogonInformation.LogonNetwork.Identity.ParameterControl** is not set, then return STATUS\_NOLOGON\_WORKSTATION\_TRUST\_ACCOUNT. [<23>](#)

If the account is a domain controller computer account, the sub-authentication package is not verified, and the **E** bit of **LogonInformation.LogonNetwork.Identity.ParameterControl** is not set, then return STATUS\_NOLOGON\_SERVER\_TRUST\_ACCOUNT. [<24>](#)

For NTLMv2 authentication [MS-NLMP], the DC MUST verify that the request originated from the NTLM server that generated the challenge:

1. The DC extracts the MsvAvNbComputerName and MsvAvNbDomainName AV pairs ([MS-NLMP] section 2.2.2.1) from the NTLMv2\_CLIENT\_CHALLENGE ([MS-NLMP] section 2.2.2.7) of the AUTHENTICATE\_MESSAGE ([MS-NLMP] section 2.2.1.3).
2. If MsvAvNbDomainName does not match the NetBIOS name of the DC's domain, then return STATUS\_LOGON\_FAILURE (section [2.2](#)).
3. If MsvAvNbComputerName does not match the NetBIOS name of the server that established the secure channel ([MS-NRPC] section 3.5.4.4.2), then return STATUS\_LOGON\_FAILURE.

If there is a match, the DC MUST return data with ValidationInformation containing a reference to NETLOGON\_VALIDATION\_SAM\_INFO4 ([MS-NRPC] section 2.2.1.4.13, if the ValidationLevel in the request is NetlogonValidationSamInfo4) or a reference to NETLOGON\_VALIDATION\_SAM\_INFO2 ([MS-NRPC] section 2.2.1.4.12, if the ValidationLevel in the request is NetlogonValidationSamInfo2) or a reference to NETLOGON\_VALIDATION\_SAM\_INFO ([MS-NRPC] section 2.2.1.4.11, if the ValidationLevel in the request is NetlogonValidationSamInfo). If there is not a match, the DC MUST return a failure error code STATUS\_LOGON\_FAILURE with no response data. [<25>](#)

### 3.1.5.2.1 Verifying Responses with Sub-Authentication Packages

The request to verify by a sub-authentication package is indicated by the **ParameterControl** field of the *LogonInformation* parameter. [<26>](#)

An example of sub-authentication package usage occurs with remote access authentications using the CHAP ([RFC1994]) method. In such cases, response computation of a MD5 hash value ([RFC1994]) is used instead of NTOWF.

Using the NRPC generic pass-through ([MS-NRPC] section 3.2.4.1) MAY result in invoking a custom sub-authentication package at the DC, per the indication of the **ParameterControl** field of the *LogonInformation* parameter. In this case, such a sub-authentication package MUST serve as a custom response verification instead of using the method specified by section 3.3 of [MS-NLMP]. For more information about this sub-authentication package, see [\[MSDN-0SUBAUTHROUTINE9\]](#).

### 3.1.6 Timer Events

There are no timer events for NTLM logon. All associated timer events are specified in the Netlogon Remote Protocol ([\[MS-NRPC\]](#)) that serves as the transport.

### 3.1.7 Other Local Events

None.

## 3.2 Kerberos PAC Validation Details

Kerberos PAC validation SHOULD use the generic pass-through mechanism ([\[MS-NRPC\]](#) section 3.2.4.1). The [KERB\\_VERIFY\\_PAC\\_REQUEST](#) message (section 2.2.2.1) MUST be sent to the domain controller (DC) for privilege attribute certificate (PAC) verification. The signature verification algorithm MUST occur (section [3.2.5](#)).

### 3.2.1 Abstract Data Model

The protocol requires that the DC MUST have a database or directory of accounts with Kerberos keys ([\[MS-KILE\]](#) section 3.1.1.2) available to it.

The server operating system MUST have the PAC.

The Netlogon abstract data model is specified in [\[MS-NRPC\]](#) section 3.2.1.

### 3.2.2 Timers

None.

### 3.2.3 Initialization

None.

### 3.2.4 Higher-Layer Triggered Events

For information on higher-layer triggered events, see section [1.6.2](#).

### 3.2.5 Message Processing Events and Sequencing Rules

Kerberos PAC validation is a stateless protocol with request-response semantics.

#### 3.2.5.1 Generating a KERB\_VERIFY\_PAC\_REQUEST Message

The server operating system MUST first assemble the [KERB\\_VERIFY\\_PAC\\_REQUEST \(section 2.2.2.1\)](#) structure by copying the signature values out of the privilege attribute certificate (PAC) ([\[MS-PAC\]](#) section 2.8) that the server operating system is verifying. The message type field MUST be set to 0x00000003 to make the server operating system ready to contact the DC.

This exchange MUST be layered on top of the Netlogon generic pass-through ([\[MS-NRPC\]](#) section 3.2.4.1). The server operating system MUST supply a KERB\_VERIFY\_PAC\_REQUEST structure, packed as a single buffer, as the **LogonData** field. The **PackageName** field MUST be set to a UNICODE\_STRING with a buffer of Kerberos.

If the DC cannot be reached, Netlogon ([MS-NRPC] section 3) MUST return the error STATUS\_NO\_LOGON\_SERVERS (section 2.2). The server operating system SHOULD fail the authentication attempt.

### 3.2.5.2 Processing a KERB\_VERIFY\_PAC\_REQUEST Message

On receipt of the message, the DC MUST decode the [KERB\\_VERIFY\\_PAC\\_REQUEST \(section 2.2.2.1\)](#) message to locate the server checksum and the Key Distribution Center (KDC) checksum values. The DC MUST verify the KDC checksum, which is a keyed hash [\[RFC4757\]](#) over the server checksum passed in the request. If the checksum verification fails, the DC MUST return an error code, STATUS\_LOGON\_FAILURE (section 2.2) as the return value to the Netlogon Generic Pass-through method. If the checksum is verified, the DC MUST return STATUS\_SUCCESS. There is no return message.

When the method completes, the server operating system MUST examine the return code to determine if the PAC contents has been altered. Any nonzero return code MUST be treated by the server operating system as a failure.

### 3.2.6 Timer Events

There are no timer events for Kerberos PAC validation. All associated timer events are specified in the Netlogon Remote Protocol [\[MS-NRPC\]](#) that serves as the transport for Kerberos PAC validation messages.

### 3.2.7 Other Local Events

There are no other local events that impact the operation of this protocol.

## 3.3 Digest Validation Details

The Digest validation protocol SHOULD use the generic pass-through mechanism ([\[MS-NRPC\]](#) section 3.2.4.1). The exchanged messages are [DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) and [DIGEST\\_VALIDATION\\_RESP \(section 2.2.3.2\)](#). The DIGEST\_VALIDATION\_RESP message MUST contain the status of authentication validation and, on success, MUST also contain the user's authorization information. <27>

### 3.3.1 Abstract Data Model

The protocol requires that the DC MUST have a database or directory of accounts with authentication and authorization information available to it. All state information, specifically the nonce challenge that foils replay attacks ([\[MS-DPSP\]](#) section 3.2.1) MUST be handled by the participants of the Digest authentication protocol [\[RFC2617\]](#) [\[RFC2831\]](#), and MUST be sent as part of the [DIGEST\\_VALIDATION\\_REQ](#) message.

### 3.3.2 Timers

None.

### 3.3.3 Initialization

None.

### 3.3.4 Higher-Layer Triggered Events

The Digest validation message exchange SHOULD be triggered by a server that is configured to authenticate users by using the Digest authentication mechanism [\[RFC2617\]](#) [\[RFC2831\]](#).<28>

### 3.3.5 Message Processing Events and Sequencing Rules

Digest validation is a stateless protocol with request-response semantics. The general model is as follows:

1. After the Digest server sends the [DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) message, it MUST receive either a [DIGEST\\_VALIDATION\\_RESP \(section 2.2.3.2\)](#) message from the DC or an error status in the Netlogon generic pass-through function ([\[MS-NRPC\]](#) section 3.2.4.1).
2. Upon receiving the DIGEST\_VALIDATION\_REQ message, the DC MUST verify the keyed hash contained in the Payload buffer's **Response** field, and then send the DIGEST\_VALIDATION\_RESP message to the Digest server.

#### 3.3.5.1 Generating the DIGEST\_VALIDATION\_REQ Message

The Digest server MUST construct the [DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) message by using fields extracted from the digest-challenge and digest-response messages ([\[RFC2617\]](#) section 3.2 and [\[RFC2831\]](#) section 2.1). This message MUST be sent to the DC to verify the validity of the user's signature (keyed hash performed with the user's password) and to retrieve the privilege attribute certificate (PAC) for the user's account. If the DC cannot be contacted for any reason, the Digest server SHOULD fail the authentication attempt.

The DIGEST\_VALIDATION\_REQ message MUST be packed as a contiguous buffer, and the encoded data SHOULD be sent by using the generic pass-through mechanism ([\[MS-NRPC\]](#) section 3.2.4.1). The encoding of the DIGEST\_VALIDATION\_REQ is as specified in section 2.2.3.1. The **PackageName** ([\[MS-NRPC\]](#) section 3.2.4.1) in the NETLOGON\_GENERIC\_INFO structure ([\[MS-NRPC\]](#) section 2.2.1.4.2) MUST be WDigest. The **AlgType** field of the DIGEST\_VALIDATION\_REQ (section 2.2.3.1) message MUST be set to 0x03.<29>

#### 3.3.5.2 Request Processing and Generating DIGEST\_VALIDATION\_RESP Message

If the **AlgType** field of the [DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) is not set to 0x03, then the DC SHOULD return SEC\_E\_QOP\_NOT\_SUPPORTED.<30>

Using the **Username** field in the **Payload** field of the DIGEST\_VALIDATION\_REQ (section 2.2.3.1) message, the DC MUST look up the user's password. If the account is not found and Bit A of the **Flags** field of the DIGEST\_VALIDATION\_REQ message is set to:

**0:** The DC SHOULD return STATUS\_NO\_SUCH\_USER.

**1:** If the **domain name** in the **Realm** field matches the DC's domain name, then fail with STATUS\_LOGON\_FAILURE. Otherwise, using the **Realm** field in the **Payload** field of the DIGEST\_VALIDATION\_REQ message to determine the domain, the DC SHOULD send the DIGEST\_VALIDATION\_REQ message to a DC in that domain.

The DC MUST verify the keyed hash contained in the Payload buffer's **Response** field of the DIGEST\_VALIDATION\_REQ (section 2.2.3.1) message. The algorithm to perform this validation MUST be as specified in [\[RFC2617\]](#) section 3.2.2.1 and [\[RFC2831\]](#) section 2.1.2.1.

If validation is successful, a [DIGEST\\_VALIDATION\\_RESP \(section 2.2.3.2\)](#) message with Status [\[MS-ERREF\]](#) indicating successful authentication (that is, STATUS\_SUCCESS) and authorization information for the user's account (the PAC) MUST be sent back to the Digest server. If unsuccessful, the DC

MUST return an error code as an error status in NRPC API. It MUST NOT send back the DIGEST\_VALIDATION\_RESP message.

The Digest validation response message DIGEST\_VALIDATION\_RESP MUST be packed as a contiguous buffer, and the encoded data SHOULD be sent by using the generic pass-through mechanism ([\[MS-NRPC\]](#) section 3.2.4.1). The encoding of DIGEST\_VALIDATION\_RESP is as specified in section 2.2.3.2. The Digest validation response message is sent by using the generic pass-through mechanism, as specified in [\[MS-NRPC\]](#) section 3.2.4.1.

### **3.3.6 Timer Events**

There are no timer events for the Digest validation protocol. All associated timer events are specified in the Netlogon Remote Protocol ([\[MS-NRPC\]](#)) that serves as the transport for Digest validation messages.

### **3.3.7 Other Local Events**

There are no other local events that impact the operation of this protocol.

## 4 Protocol Examples

### 4.1 NTLM Pass-Through Authentication

**Figure 2: NTLM pass-through authentication**

1. The user logs on to the computer desktop (labeled Client) by typing in the user name and password. Client sends an NTLM NEGOTIATE\_MESSAGE ([MS-NLMP] section 2.2.1.1) to request authentication to the server.
2. The server sends an NTLM CHALLENGE\_MESSAGE ([MS-NLMP] section 2.2.1.2) to the client.
3. The client responds to the challenge by signing it with its key and sending the response in an NTLM AUTHENTICATE\_MESSAGE ([MS-NLMP] section 2.2.1.3) to the server.
4. The server forwards the client's response to the domain controller in a NETLOGON\_NETWORK\_INFO message.
5. The domain controller verifies the signature on the response, and returns the result to the server in a NETLOGON\_VALIDATION\_SAM\_INFO4 message. If the verification is successful, the message contains the user's PAC with the authorization data. If the verification is unsuccessful, logon is denied.

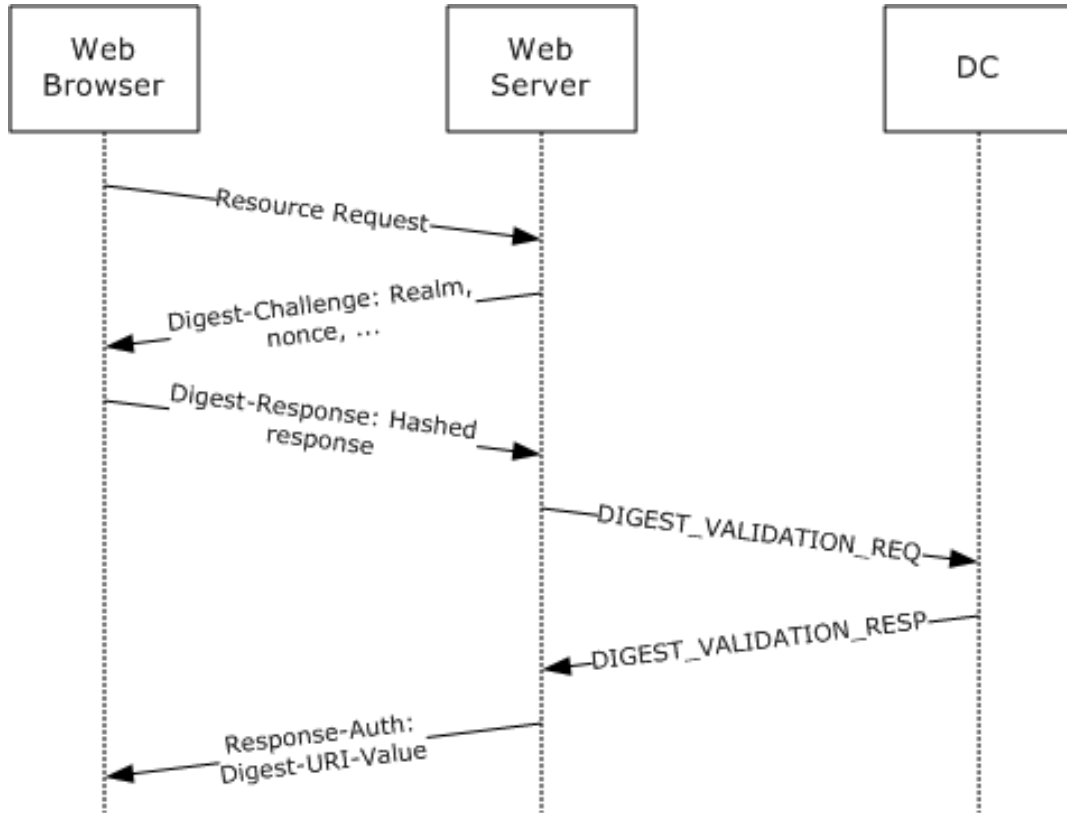

## 4.2 Kerberos PAC Validation

**Figure 3: PAC validation**

1. The client tries to access a resource requiring Kerberos authentication. The client sends an AP-REQ message to request authentication from the server.
2. The server passes the PAC to the operating system to receive an access token. The server operating system forwards the PAC signature in the AP-REQ to the domain controller for verification in a KERB\_VERIFY\_PAC message.
3. The domain controller verifies the signature on the response and returns the result to the server. The error is returned as the appropriate RPC status code.
4. The server verifies the AP-REQ, and sends an AP-REP if the verification is successful.

### 4.3 Digest Validation Protocol

**Figure 4: Digest validation protocol**

1. The web server is configured to require Digest authentication to gain access to certain documents. A user attempts to gain access to the protected document by using a web browser. The web server returns the Digest-Challenge message, as specified in [\[RFC2617\]](#) section 3.3. This challenge message includes a randomly generated nonce intended to foil replay attacks.
2. The web browser obtains the user name and password for the user and constructs a response to the server's challenge. In the Digest-Response, the client proves knowledge of the user's password by performing a keyed hash over the user name, nonce, and other fields (the password is fed into the hash).
3. To validate the Digest-Response message, the web server constructs the [DIGEST\\_VALIDATION\\_REQ \(section 2.2.3.1\)](#) message and sends it to the DC. The [DIGEST\\_VALIDATION\\_REQ](#) includes the nonce and the keyed hash value from the Digest-Response message. On receiving the [DIGEST\\_VALIDATION\\_REQ](#) message, the DC validates the message by performing the following steps:
  1. Looks up the user's password by using the user name.
  2. Recomputes the keyed hash over the clear-text fields from the Digest-Response message.
  3. Compares the resulting value to the value sent by the client.
4. If the DC's computed hash and the hash sent by the client match, the DC creates and sends back the [DIGEST\\_VALIDATION\\_RESP \(section 2.2.3.2\)](#) message with Status indicating successful authentication (that is, [STATUS\\_SEVERITY\\_SUCCESS](#)), as specified in [\[MS-ERREF\]](#) section 2.3, and authorization information for the user's account (the PAC). Otherwise, the DC returns an error

code as an error status in NRPC API. It does not send back the DIGEST\_VALIDATION\_RESP message.

5. For mutual authentication, the server has the option to send a keyed hash over the URI that the client requested, and return it to the client in the Response-Auth message. Note that sending the Response-Auth message applies only to Digest authentication when used as a Simple Authentication and Security Layer (SASL) mechanism, as specified in [\[RFC2831\]](#) section 2.1.3.

## 5 Security

### 5.1 Security Considerations for Implementers

Authentication Protocol Domain Support does not have any built-in security mechanisms to provide authentication or to ensure confidentiality and integrity. Instead, it relies on security mechanisms that are specified in [\[MS-RPCE\]](#) section 5 to protect Netlogon RPC [\[MS-NRPC\]](#), which serves as the transport for the protocols defined in this document.

The Digest authentication protocol itself offers some level of protection (that is, it does not send the user's password in the clear) but is considered weaker than Kerberos [\[MS-KILE\]](#) and public key-based authentication (for example, client-side authentication). Consequently, the Digest Protocol Extensions should be used only in environments in which these stronger mechanisms are unavailable.

### 5.2 Index of Security Parameters

There are no security parameters for Authentication Protocol Domain Support. All associated security parameters are specified in the Netlogon Remote Protocol [\[MS-NRPC\]](#), which provides all security for Authentication Protocol Domain Support messages.

## 6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

Note: Some of the information in this section is subject to change because it applies to a preliminary product version, and thus may differ from the final version of the software when released. All behavior notes that pertain to the preliminary product version contain specific references to it as an aid to the reader.

- Windows NT operating system
- Windows 2000 operating system
- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 Technical Preview operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> [Section 1.6.1](#): The Kerberos protocol is preferred for interactive logon. The NTLM protocol is always used for interactive logon when the domain controller is running Windows NT Server 4.0 operating system.

Network logon using NTLM is applicable under any one of the following situations:

- Client or application is explicitly configured to use NTLM.
- Client or application uses an invalid target name (the server's **principal** name) and cannot log on by using Kerberos.
- Client or application specifies a target name that cannot be resolved and, therefore, cannot log on by using Kerberos.

<2> [Section 1.6.2](#): The following list details the behavior of each version of Windows.

- Windows 2000 Server operating system and Windows XP do not validate the PAC when the application server is running under the local system context or has SeTcbPrivilege, as specified in [\[MS-LSAD\]](#) section 3.1.1.2.1. Otherwise, Windows 2000 Server and Windows XP use Kerberos PAC validation.
- Windows Server 2003 does not validate the PAC when the application server is running under the local system context, the network service context, or has SeTcbPrivilege. Otherwise, Windows Server 2003 uses Kerberos PAC validation.
- Windows Server 2003 operating system with Service Pack 1 (SP1) does not validate the PAC when the application server is under the local system context, the network service context, the local service context, or has SeTcbPrivilege privilege. Otherwise, Windows Server 2003 with SP1 and future service packs use Kerberos PAC validation.
- Windows Vista and all subsequent Windows products, according to the applicability list at the beginning of this section, do not validate the PAC by default for services. Windows still validates the PAC for processes that are not running as services. PAC validation can be enabled when the application server is not running in the context of local system, network service, or local service; or it does not have SeTcbPrivilege, as specified in [\[MS-LSAD\]](#) section 3.1.1.2.1.

<3> [Section 3.1.1](#): In Windows 2000, the following parameter is provided by the application to the NTLM server. These logical parameters can influence various protocol-defined flags.

**AllowComputerLogon:** A Boolean setting which indicates that the caller wants to authenticate a computer. Setting this flag results in the **K** bit being set in **LogonInformation.LogonNetwork.Identity.ParameterControl**.

<4> [Section 3.1.1](#): Not supported on Windows NT, Windows 2000, Windows XP, Windows Server 2003, Windows Vista, or Windows Server 2008. Where supported, the default is FALSE.

<5> [Section 3.1.1](#): Not supported on Windows 2000, Windows Server 2003, or Windows Server 2008. Where supported, the default is FALSE.

<6> [Section 3.1.1](#): Not supported on Windows 2000, Windows Server 2003, or Windows Server 2008. Where supported, the default is FALSE.

<7> [Section 3.1.1](#): Not supported on Windows 2000, Windows Server 2003, and Windows Server 2008. Where supported, the default is NULL.

<8> [Section 3.1.5](#): None of the Windows versions of APDS have been updated to use the NetrLogonSamLogonEx method. Windows uses NetrLogonSamLogonWithFlags (Opnum 45).

<9> [Section 3.1.5](#): None of the Windows versions of APDS have been updated to use the NetrLogonSamLogonEx method. Windows uses NetrLogonSamLogonWithFlags (Opnum 45).

<10> [Section 3.1.5](#): Not supported on Windows NT, Windows 2000, Windows XP, Windows Server 2003, Windows Vista, or Windows Server 2008.

<11> [Section 3.1.5](#): Not supported on Windows 2000, Windows Server 2003, or Windows Server 2008.

<12> [Section 3.1.5](#): Not supported on Windows 2000, Windows Server 2003, or Windows Server 2008.

<13> [Section 3.1.5](#): msDS-UserAllowedToAuthenticateFrom is not supported by Windows 2000, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, or Windows Server 2012.

<14> [Section 3.1.5](#): msDS-ServiceAllowedToAuthenticateFrom is not supported by Windows 2000, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, or Windows Server 2012.

<15> [Section 3.1.5](#): AllowedToAuthenticateTo is not supported by Windows 2000, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, or Windows Server 2012 DCs.

<16> [Section 3.1.5](#): PROTECTED\_USERS is not supported by Windows 2000, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, or Windows Server 2012.

<17> [Section 3.1.5.1](#): None of the Windows versions of APDS have been updated to use the NetrLogonSamLogonEx method. Windows uses NetrLogonSamLogonWithFlags (Opnum 45).

<18> [Section 3.1.5.1](#): In Windows NT 4.0 operating system and Windows 2000 Server, the ValidationLevel is NETLOGON\_VALIDATION\_SAM\_INFO2.

<19> [Section 3.1.5.1](#): If the DC returns a failure code, Windows fails the logon attempt. Other failure codes are also returned based on the policy (for a list of error codes, see [\[MS-ERREF\]](#)), and all of them result in logon failure.

When a Windows XP NETLOGON client talks with a Windows 2000 DC, Netlogon is responsible for negotiating the minimal ValidationLevel that is supported. This negotiated ValidationLevel is used, and the corresponding validation information is returned, as specified in [\[MS-NRPC\]](#) section 3.5.4.5.1. Note that the NETLOGON\_VALIDATION\_SAM\_INFO4 structure is a superset of the NETLOGON\_VALIDATION\_SAM\_INFO2 structure.

<20> [Section 3.1.5.2](#): None of the Windows versions of APDS have been updated to use the NetrLogonSamLogonEx method. Windows uses NetrLogonSamLogonWithFlags (Opnum 45).

<21> [Section 3.1.5.2](#): In Windows NT and Windows 2000 Server, the default ValidationLevel is NETLOGON\_VALIDATION\_SAM\_INFO2.

<22> [Section 3.1.5.2](#): In Windows 2000, if **AllowComputerLogon** is not set, then the **K** bit of **LogonInformation.LogonNetwork.Identity.ParameterControl** is not set. In Windows NT, NTLM servers never set the **K** bit.

<23> [Section 3.1.5.2](#): In Windows NT, the DC cannot authenticate computer accounts.

<24> [Section 3.1.5.2](#): In Windows NT, the DC cannot authenticate domain controller computer accounts.

<25> [Section 3.1.5.2](#): When a Windows XP NETLOGON client talks with a Windows 2000 DC, Netlogon is responsible for negotiating the minimal ValidationLevel that is supported. This negotiated ValidationLevel is used, and the corresponding validation information is returned, as specified in [\[MS-NRPC\]](#) section 2.2.1.4.17. Note that the NETLOGON\_VALIDATION\_SAM\_INFO4 structure is a superset of the NETLOGON\_VALIDATION\_SAM\_INFO2 structure.

On Windows 2000 Server DCs and subsequent versions of Windows Server DCs, according to the applicability list at the beginning of the section, the user information contained in the NETLOGON\_VALIDATION\_SAM\_INFO4 structure is obtained by querying Active Directory.

<26> [Section 3.1.5.2.1](#): The **ParameterControl** field provides an extensibility point for software providers. Windows XP and all subsequent Windows products, according to the applicability list at the beginning of the section, do not have sub-authentication packages installed by default.

<27> [Section 3.3](#): The validation protocol uses the generic pass-through mechanism, as specified in [\[MS-NRPC\]](#) section 3.2.4.1. The Digest validation server is always a domain controller, and the Digest authentication client can be a member server of a domain or another DC in the same forest. The DC can also contact another DC in the same forest by using the [DIGEST\\_VALIDATION\\_REQ](#) and [DIGEST\\_VALIDATION\\_RESP](#) exchange, if the user's account is located in a different domain than that of the DC that receives the request. Windows client products (such as Windows XP, Windows Vista, Windows 7, Windows 8, Windows 8.1, and Windows 10) do not support digest in this manner.

<28> [Section 3.3.4](#): During the Digest authentication exchange (as specified in [\[RFC2617\]](#) and [\[RFC2831\]](#)), the Digest server initiates the Digest validation exchange with the DC. This transaction that is initiated by the Digest server does not have direct access to the user's password and relies on the DC to validate the digest input data sent by the client.

<29> [Section 3.3.5.1](#): Windows 2000 can send other **AlgType** values.

<30> [Section 3.3.5.2](#): Windows 2000 Server will not fail the DIGEST\_VALIDATION\_REQ request.

## 7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.
- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact [dochelp@microsoft.com](mailto:dochelp@microsoft.com).

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
<a href="#">3.1.1</a> Abstract Data Model	Added missing element name to union parameter. ... LogonInformation.LogonNetwork.Identity.ParameterControl.	Y	Protocol syntax updated.
<a href="#">3.1.5.2</a> NTLM Network Logon	Added missing element name to union parameter. ... LogonInformation.LogonNetwork.Identity.ParameterControl.	Y	Protocol syntax updated.
