

[MS-DVRE]: Device Registration Enrollment Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft [Open Specification Promise](#) or the [Community Promise](#). If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **Trademarks.** The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

Date	Revision History	Revision Class	Comments
08/08/2013	1.0	New	Released new document.
11/14/2013	1.0	No change	No changes to the meaning, language, or formatting of the technical content.
02/13/2014	2.0	Major	Significantly changed the technical content.
05/15/2014	3.0	Major	Significantly changed the technical content.

1 Introduction

The Device Registration Enrollment Protocol provides a lightweight mechanism for registering personal or corporate-owned devices with a workplace.

Whereas the discovery of information needed to register devices is obtained by use of the Device Registration Discovery Protocol [MS-DVRD], the Device Registration Enrollment Protocol, defined in this specification, makes use of that information to register a device in the device registration service.

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. Sections 1.5 and 1.9 are also normative but cannot contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [MS-GLOS]:

ACL
Active Directory
administrators
Coordinated Universal Time (UTC)
distinguished name (DN)
globally unique identifier (GUID)
GUID
Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)
object identifier (OID)
SID
SOAP action
SOAP body
SOAP fault
SOAP header
SOAP message
user principal name (UPN)
UTC (Coordinated Universal Time)
WSDL message
WSDL operation

The following terms are specific to this document:

JSON Web token: A type of token that includes a set of claims encoded as a JSON object. For more information, see [IETFDRAFT-JWT].

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

The Device Registration Enrollment Protocol provides for issuance of X.509v3 digital certificates, and is intended for use as a lightweight device registration server. The server is known in WS-Trust [\[WSTrust1.3\]](#) terminology as a security token service (STS). The protocol is based loosely on [\[MS-WSTEP\]](#).

This document defines and uses the following term:

Directory Server: Refers to the directory database that will store the device-object record and policy information for the server.

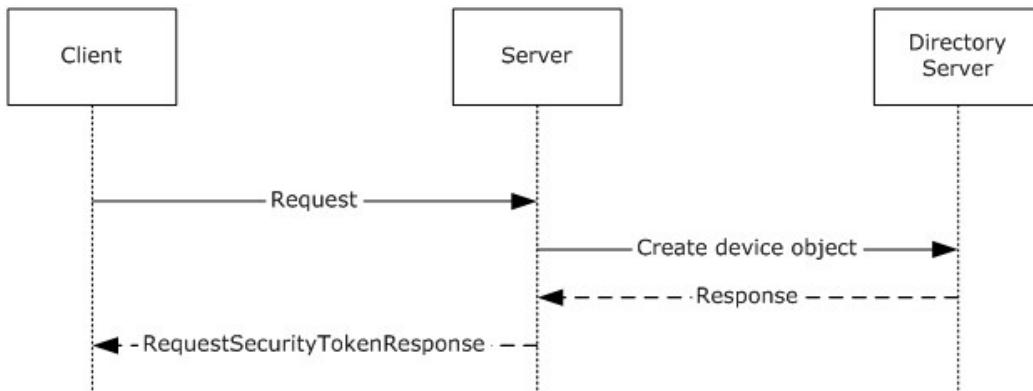

Figure 1: Typical sequence diagram for Device Registration

1.4 Relationship to Other Protocols

The following figure shows the Device Registration Enrollment protocol stack diagram.

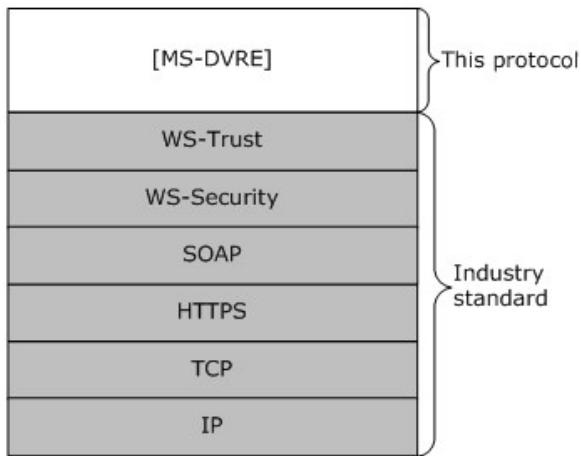

Figure 2: Device Registration Enrollment protocol stack

The Device Registration Enrollment protocol makes use of the **Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS)** and SOAP protocols for messaging and security.

1.5 Prerequisites/Preconditions

The Device Registration Enrollment protocol issues X.509v3 certificates that have a corresponding relationship with a device object represented in a directory server. A server implementation of the protocol requires the functionality of a certificate authority and a directory server.

This protocol requires that the following state changes be made to **Active Directory**.

1. Create an instance of the **ms-DS-Device-Registration-Service-Container** class in the directory.
2. Create an instance of the ms-DS-Device-Registration-Service class as a child of the container object created in the previous step with the following attributes.
 1. Set the **ms-DS-Registration-Quota** attribute of the **ms-DS-Device-Registration-Service** object to 10.
 2. Set the **ms-DS-Maximum-Registration-Inactivity-Period** attribute of the **ms-DS-Device-Registration-Service** object to 90.
 3. Set the **ms-DS-Is-Enabled** attribute of the **ms-DS-Device-Registration-Service** object to TRUE.
 4. Set the **ms-DS-Device-Location** attribute of the **ms-DS-Device-Registration-Service** object to a **distinguished name (DN)** of a container location in the directory. The container is of class ms-DS-Device-Container.
3. Generate a certificate signing certificate. The certificate and private key must be stored in the **ms-DS-Issuer-Certificates** attribute of the **ms-DS-Device-Registration-Service** object. See section [2.3.1](#).

The public portion of the certificate must be stored in the **ms-DS-Issuer-Public-Certificates** attribute of the **ms-DS-Device-Registration-Service** object. See section [2.3.2](#).

4. Set the following directory **ACL** entries:

1. Grant the server read access to the **ms-DS-Device-Registration-Service** object.
2. Grant the server read/write access to **ms-DS-Device** objects.

1.6 Applicability Statement

The Device Registration Enrollment protocol is applicable only for requests for device registration.

1.7 Versioning and Capability Negotiation

None.

1.8 Vendor-Extensible Fields

The Device Registration Enrollment protocol does not include any vendor-extensible fields.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

The Device Registration Enrollment protocol operates over the following transports:

- Web Services: SOAP 1.2 ([\[SOAP1.2-1/2003\]](#) and [\[SOAP1.2-2/2003\]](#)) over HTTPS over TCP/IP ([\[RFC2616\]](#))

The protocol MUST operate on the following URI endpoint.

Web service	Location
Enrollment Web Service	<a href="https://<server>:<server port>/EnrollmentServer/DeviceEnrollmentWebService.svc">https://<server>:<server port>/EnrollmentServer/DeviceEnrollmentWebService.svc

The protocol MUST use the HTTPS transport.

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses the XML schema as defined in [\[XMLSCHEMA1\]](#) and [\[XMLSCHEMA2\]](#), and the Web Services Description Language as defined in [\[WSDL\]](#).

2.2.1 Namespaces

This specification defines and references various XML namespaces by using the mechanisms specified in [\[XMLNS\]](#). Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefix	Namespace URI	Reference
q2	http://schemas.datacontract.org/2004/07/Microsoft.DeviceRegistration	
xsd	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1]

2.2.2 Messages

This specification does not define any common XML schema message definitions.

2.2.3 Elements

This specification does not define any common XML schema element definitions.

2.2.4 Complex Types

This specification does not define any common XML schema complex type definitions.

2.2.5 Simple Types

This specification does not define any common XML schema simple type definitions.

2.2.6 Attributes

This specification does not define any common XML schema attribute definitions.

2.2.7 Groups

This specification does not define any common XML schema group definitions.

2.2.8 Attribute Groups

This specification does not define any common XML schema attribute group definitions.

2.2.9 Common Data Structures

This specification does not define any common XML schema data structures.

2.3 Directory Service Schema Elements

The protocol accesses the following Directory Service schema classes and attributes listed in the following table.

For the syntactic specifications of the following <Class> or <Class><Attribute> pairs, refer to:

Active Directory Domain Services (AD DS) ([\[MS-ADA1\]](#), [\[MS-ADA2\]](#), [\[MS-ADA3\]](#), and [\[MS-ADSC\]](#)).

Class	Attribute
ms-DS-Device	Alt-Security-Identities ms-DS-Device-ID ms-DS-Device-OS-Type ms-DS-Device-OS-Version ms-DS-Registered-Users ms-DS-Is-Enabled ms-DS-Approximate-Last-Logon-Time-Stamp ms-DS-Registered-Owner Display-Name

Class	Attribute
ms-DS-Device-Container	
ms-DS-Device-Registration-Service	ms-DS-Issuer-Certificates ms-DS-Issuer-Public-Certificates ms-DS-Registration-Quota ms-DS-Maximum-Registration-Inactivity-Period ms-DS-Device-Location ms-DS-Is-Enabled
ms-DS-Device-Registration-Service-Container	
user	objectGuid
domain	objectGuid
nTDSDSA	invocationId

2.3.1 ms-DS-Issuer-Certificates

The **ms-DS-Issuer-Certificates** attribute is a multi-valued OCTET_STRING attribute. Each value of the attribute is stored as a Binary blob containing the following formatted data:

"[time]:[binary value of an X.509 certificate]"

Where **[time]** is timestamp formatted as an integer representing the number of 100-nanosecond intervals that have elapsed since 12:00:00 midnight, January 1, 0001 and **[binary value of an X.509 certificate]** is the contents of an X.509 certificate [\[RFC5280\]](#) stored as an encrypted binary blob.

2.3.2 ms-DS-Issuer-Public-Certificates

The **ms-DS-Issuer-Public-Certificates** attribute is a multi-valued OCTET_STRING attribute. Each value of the attribute is stored as a binary blob containing an X.509 certificate [\[RFC5280\]](#).

2.3.3 Alt-Security-Identities

The **Alt-Security-Identities** attribute is a multi-valued UNICODE_STRING attribute. The value is formatted as:

X509:<SHA1-TP-PUBKEY>[thumbprint]+[publickeyhash]

Where **[thumbprint]** is the SHA1 hash of a certificate and **[publickeyhash]** is the base64 encoded SHA1 hash of the X.509 certificate public key [\[RFC5280\]](#).

3 Protocol Details

3.1 IWindowsDeviceEnrollmentService Server Details

The **IWindowsDeviceEnrollmentService** hosts a message endpoint that receives **RequestSecurityToken** messages (section [3.1.4.1](#)). When received, the server processes the client request, creates and signs an X.509 certificate [[RFC5280](#)], and then contacts the directory server to create a device object. Upon receiving a response from the directory server, a response is generated, and the server sends either a **RequestSecurityTokenResponse** message (section [3.1.4.1.1.2](#)) or a **SOAP fault**. When the message has been sent to the client, the server returns to the waiting state.

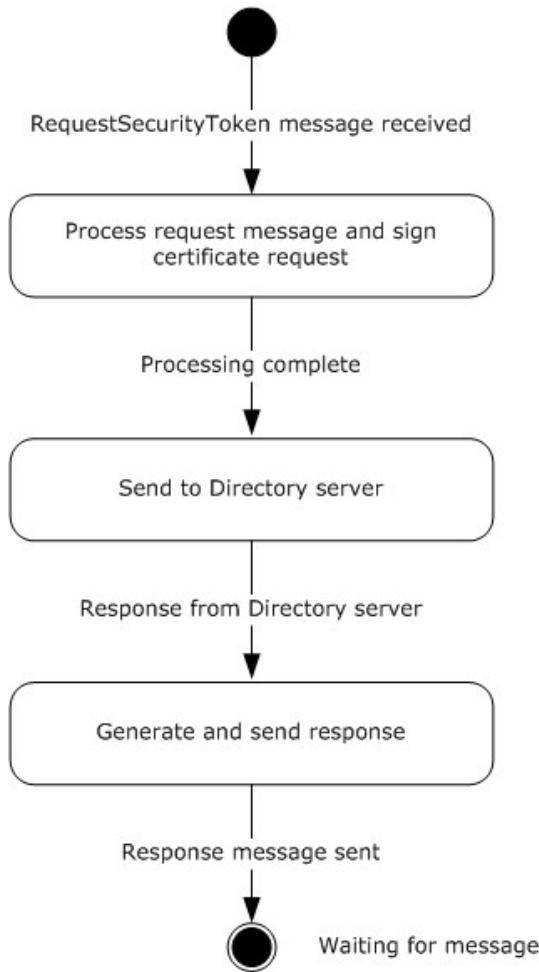

Figure 3: State model for security token service

The items of information that are communicated between the server and the directory server are specified in subsequent sections of this document.

Authentication

The WS-Trust X.509v3 Enrollment Protocol Extensions [MS-WSTEP] use the authentication provisions in WS-Security [WSS] to enable the X.509v3 Security Token issuer to authenticate the X.509v3 Security Token requestor. The following information defines the schema used to express the credential descriptor for each supported credential type.

- Token Authentication

The token credential is provided in a request message by using the WS-Trust BinarySecurityToken definition as defined in section [3.1.4.1.2.3](#).

3.1.1 Abstract Data Model

None.

3.1.2 Timers

StaleDeviceCleanup: A periodic timer that is used to remove unused devices. This timer triggers activity at a random time, once every 24 hours.

3.1.3 Initialization

The following initialization steps MUST be performed each time the server service starts:

1. Read the **ms-DS-Is-Enabled** attribute of the **ms-DS-Device-Registration-Service** object. If the value is FALSE, the server service MUST shut down.
2. The web service on the server MUST be listening for requests from the client.

3.1.4 Message Processing Events and Sequencing Rules

The following table summarizes the list of all **WSDL operations** as defined by this specification.

WSDL Operation	Description
RequestSecurityToken	The RequestSecurityToken operation is the sole operation in the Device Registration Enrollment Protocol. It provides the mechanism for device registration requests.

3.1.4.1 RequestSecurityToken

The client calls the **RequestSecurityToken** method to register a device.

This operation is specified by the following WSDL.

```
<wsdl:operation name="RequestSecurityToken">
  <wsdl:input
    wsaw:Action="http://schemas.microsoft.com/windows/pki/2009/01/enrollment/RST/wstep"
    message="tns:IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage"/>
  <wsdl:output
    wsaw:Action="http://schemas.microsoft.com/windows/pki/2009/01/enrollment/RSTRC/wstep"
    message="tns:IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage"/>
  <wsdl:fault
    wsaw:Action="http://schemas.microsoft.com/windows/pki/2009/01/enrollment/IWindowsDeviceEnrollmentService/RequestSecurityTokenWindowsDeviceEnrollmentServiceErrorFault"
    name="WindowsDeviceEnrollmentServiceErrorFault"
    message="tns:IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage"/>
```

```
</wsdl:operation>
```

The **IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage** message consists of a single object definition: the client request. The client request is made by using the acceptable SOAP actions and values as defined in sections [3.1.4.1.1](#) and [3.1.4.1.2](#).

3.1.4.1.1 Messages

The following table summarizes the set of **WSDL message** definitions that are specific to this operation.

Message	Description
IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage	A request to register a device.
IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage	A response containing the signed certificate .
IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage	An error message object.

3.1.4.1.1.1

IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message

A WSDL message containing the request for the **RequestSecurityToken** WSDL operation.

The **SOAP action** value is:

```
http://schemas.microsoft.com/windows/pki/2009/01/enrollment/RST/wstep
```

The IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage request message ([\[WSTrust1.3\]](#) section 3.1 RequestSecurityToken) is sent from the client to the server to enroll a certificate and to retrieve provisioning information. The WSDL definition is:

```
<wsdl:message name="IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage">
  <wsdl:part name="request" element="wst:RequestSecurityToken"/>
</wsdl:message>
```

The **IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage** Message contains the elements that are part of a client request to a server.

The following elements MUST be included in the **SOAP header**.

- **wsse:Security:** Defined in section [3.1.4.1.2.2](#).

This element MUST be a child of the <s:Header> element.

- **wsse:BinarySecurityToken:** Defined in section [3.1.4.1.2.3](#). The ValueType attribute MUST be urn:ietf:params:oauth:token-type:jwt. The EncodingType attribute MUST be http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-soap-message-security-1.0#Base64Binary. The <wsse:BinarySecurityToken> element MUST contain a **JSON Web token** (JWT) [\[IETF DRAFT-JWT\]](#). The JWT MUST contain the following claims:

Claim	Description
http://schemas.microsoft.com/authorization/claims/PermitDeviceRegistrationClaim.	Whether the security authority has granted permission for the user to register devices.
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/upn	The user principal name (UPN) of the user that authenticated to the web service.

This element MUST be a child of the <wsse:Security> element.

The following elements MUST be included in the **SOAP body**.

- **wst:RequestSecurityToken:** Defined in section [3.1.4.1.2.4](#).

This element MUST be a child of the <s:Body> element.

- **wst:RequestType:** Defined in section [3.1.4.1.2.5](#). The <wst:RequestType> element MUST be http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue (see [\[WSTrust1.3\]](#) section 3.1).

This element MUST be a child of the <wst:RequestSecurityToken> element.

- **wst:TokenType:** Defined in section [3.1.4.1.2.6](#). For the X.509 enrollment extension to WS-Trust, the <wst:TokenType> element MUST be http://schemas.microsoft.com/5.0.0.0/ConfigurationManager/Enrollment/DeviceEnrollmentToken (see [\[WSTrust1.3\]](#) section 3.1).

This element MUST be a child of the <wst:RequestSecurityToken> element.

- **wsse:BinarySecurityToken:** Defined in section [3.1.4.1.2.3](#). The ValueType attribute MUST be http://schemas.microsoft.com/windows/pki/2009/01/enrollment#PKCS10. The EncodingType attribute MUST be http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurit-secext-1.0.xsd#base64binary. The <wsse:BinarySecurityToken> element MUST contain a base64 encoded PKCS#10 Certificate Request [\[RFC2986\]](#). The Certificate Request MUST use an RSA public key algorithm with 2048 bit key and use a SHA256WithRSAEncryption signature algorithm and SHA256 hash algorithm.

This element MUST be a child of the <wst:RequestSecurityToken> element.

- **ac:AdditionalContext:** Defined in section [3.1.4.1.2.7](#). The `<ac:AdditionalContext>` element MUST contain three `<ac:ContextItem>` child elements to represent the device type, OS version, and device display name (See [\[WSFederation\]](#) section 9.2).

This element MUST be a child of the `<wst:RequestSecurityToken>` element.
- **ac:ContextItem:** Defined in section [3.1.4.1.2.8](#). The request MUST contain the following information in `<ac:ContextItem>` elements as child elements of the `<ac:AdditionalContext>` element.

Name attribute	Description
The literal string "DeviceType"	The <code><ac:Value></code> element contains the device type.
The literal string: "ApplicationVersion"	The <code><ac:Value></code> element contains the OS version installed on the device.
The literal string: "DeviceDisplayName"	The <code><ac:Value></code> element contains the friendly name of the device.

3.1.4.1.1.2

IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage Message

A WSDL message containing the response for the **RequestSecurityToken** WSDL operation.

The SOAP action value is:

`http://schemas.microsoft.com/windows/pki/2009/01/enrollment/RSTRC/wstep`

The **IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage** ([\[WSTrust1.3\]](#) section 3.2 RequestSecurityTokenResponseCollection). The WSDL definition is:

```
<wsdl:message name="IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage">
  <wsdl:part name="responseCollection" element="wst:RequestSecurityTokenResponseCollection"/>
</wsdl:message>
```

The **IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage** message contains the elements that are part of a server response to a client.

The following elements MUST be included in the SOAP body.

- **wst:RequestSecurityTokenResponseCollection:** Defined in section [3.1.4.1.2.9](#).

This element MUST be a child of the `<s:Body>` element.
- **wst:RequestSecurityTokenResponse:** Defined in section [3.1.4.1.2.10](#).

This element MUST be a child of the `<wst:RequestSecurityTokenResponseCollection>` element (see [\[WSTrust1.3\]](#) section 3.2).
- **wst:TokenType:** Defined in section [3.1.4.1.2.6](#). The `<wst:TokenType>` element MUST be `http://schemas.microsoft.com/5.0.0.0/ConfigurationManager/Enrollment/DeviceEnrollmentToken`

This element MUST be a child of the <wst:RequestSecurityTokenResponse> element (see [\[WSTrust1.3\]](#) section 3.1).

- **wst:RequestedSecurityToken:** Defined in section [3.1.4.1.2.11](#).

This element MUST be a child of the <wst:RequestSecurityTokenResponse> element.

- **wsse:BinarySecurityToken:** Defined in section [3.1.4.1.2.3](#). The ValueType attribute MUST be <http://schemas.microsoft.com/5.0.0.0/ConfigurationManager/Enrollment/DeviceEnrollmentProvisionDoc>. The EncodingType attribute MUST be <http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd#base64binary>. The <wsse:BinarySecurityToken> element MUST contain a base64 encoded XML document formatted as a Provisioning Document (section [3.1.4.1.2.12](#)). The XML document MUST contain an X.509 Certificate [\[RFC5280\]](#).

This element MUST be a child of the <wst:RequestedSecurityToken> element.

- **ac:AdditionalContext:** Defined in section [3.1.4.1.2.7](#) (See [\[WSFederation\]](#) section 9.2).

This element MUST be a child of the <wst:RequestSecurityTokenResponse> element.

- **ac:ContextItem:** Defined in section [3.1.4.1.2.8](#). The request MUST provide the following information in <ac:ContextItem> elements as child elements of the <ac:AdditionalContext> element.

Name attribute	Description
The literal string: "UserPrincipalName"	The <ac:Value> element contains the value of the http://schemas.xmlsoap.org/ws/2005/05/identity/claims/upn claim in the JWT that was sent to the server (section 3.1.4.1.1.1).

3.1.4.1.1.3

IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message

A WSDL message containing a fault for the **RequestSecurityToken** WSDL operation.

The SOAP action value is:

<http://schemas.microsoft.com/windows/pki/2009/01/enrollment/IWindowsDeviceEnrollmentService/RequestSecurityTokenWindowsDeviceEnrollmentServiceErrorFault>

Error strings and other data contained in a SOAP action value are insignificant to the protocol. Clients MUST halt processing upon receiving a SOAP fault, and MUST ignore the action value.

The WSDL definition is:

```
<wsdl:message
  name="IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage">
  <wsdl:part name="detail" element="tns:WindowsDeviceEnrollmentServiceError"/>
</wsdl:message>
```

The

IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentSer

viceErrorFault_FaultMessage message contains the SOAP fault associated with an error in the request from the client to the server.

WindowsDeviceEnrollmentServiceError: Defined in section [3.1.4.1.2.1](#). The object MUST be included in the <s:Detail> element of a SOAP fault, and clients MUST ignore the entire WindowsDeviceEnrollmentServiceError node in the SOAP fault response.

3.1.4.1.2 Elements

The following table summarizes the WSDL element definitions that are specific to this operation.

Element	Description
WindowsDeviceEnrollmentServiceError	An object returned by the web service when an error occurs.
wsse:Security	As described in [WSS] .
wsse:BinarySecurityToken	As described in [WSS] .
wst:RequestSecurityToken	As described in [WSTrust1.3] .
wst:RequestType	As described in [WSTrust1.3] .
wst:TokenType	As described in [WSTrust1.3] .
ac:AdditionalContext	As described in [WSFederation] .
ac:ContextItem	As described in [WSFederation] .
wst:RequestSecurityTokenResponseCollection	As described in [WSTrust1.3] .
wst:RequestSecurityTokenResponse	As described in [WSTrust1.3] .
wst:RequestedSecurityToken	As described in [WSTrust1.3] .
Provisioning Document	An XML document containing a configuration profile for a mobile device.

3.1.4.1.2.1 WindowsDeviceEnrollmentServiceError

```
<xsd:element name="WindowsDeviceEnrollmentServiceError" nillable="true"
type="q2:WindowsDeviceEnrollmentServiceError"/>
```

3.1.4.1.2.2 wsse:Security

The <wsse:Security> element is defined in [\[WSS\]](#).

3.1.4.1.2.3 wsse:BinarySecurityToken

The <wsse:BinarySecurityToken> element is defined in [\[WSS\]](#).

3.1.4.1.2.4 wst:RequestSecurityToken

The <wst:RequestSecurityToken> element is defined in WS-Trust 1.3 [\[WSTrust1.3\]](#), section 3.1.

3.1.4.1.2.5 wst:RequestType

The <wst:RequestType> element is defined in [\[WSTrust1.3\]](#) section 3.1. It is an instance of a <wst:RequestTypeOpenEnum> object as defined in [\[WSTrust1.3\]](#) XML schema definition (XSD).

3.1.4.1.2.6 wst:TokenType

The <wst:TokenType> element is defined in [\[WSTrust1.3\]](#), section 3.1.

3.1.4.1.2.7 ac:AdditionalContext

The <ac:AdditionalContext> element is defined in [\[WSFederation\]](#). It is used to provide additional information in a wst:RequestSecurityToken and wst:RequestSecurityTokenResponseCollection messages.

3.1.4.1.2.8 ac:ContextItem

The <ac:ContextItem> element is defined in [\[WSFederation\]](#). It is a child element of <ac:AdditionalContext> and is used to provide additional information in a wst:RequestSecurityToken message. See sections [3.1.4.1.1.1](#) and [3.1.4.1.1.2](#) for additional requirements.

3.1.4.1.2.9 wst:RequestSecurityTokenResponseCollection

The <wst:RequestSecurityTokenResponseCollection> element is defined in [\[WSTrust1.3\]](#), section 3.1.

3.1.4.1.2.10 wst:RequestSecurityTokenResponse

The <wst:RequestSecurityTokenResponse> element is defined in [\[WSTrust1.3\]](#), section 3.1.

3.1.4.1.2.11 wst:RequestedSecurityToken

The <wst:RequestedSecurityToken> element is defined in [\[WSTrust1.3\]](#), section 3.1.

3.1.4.1.2.12 Provisioning Document Schema

```
<?xml version="1.0" encoding="utf-8"?>
<xss:schema id="NewDataSet" xmlns="" xmlns:xss="http://www.w3.org/2001/XMLSchema"
  xmlns:msdata="urn:schemas-microsoft-com:xml-msdata">
  <xss:element name="characteristic">
    <xss:complexType>
      <xss:sequence>
        <xss:element name="parm" minOccurs="0" maxOccurs="unbounded">
          <xss:complexType>
            <xss:attribute name="name" type="xs:string" />
            <xss:attribute name="value" type="xs:string" />
          </xss:complexType>
        </xss:element>
        <xss:element ref="characteristic" minOccurs="0" maxOccurs="unbounded" />
      </xss:sequence>
      <xss:attribute name="type" type="xs:string" />
    </xss:complexType>
  </xss:element>
  <xss:element name="wap-provisioningdoc">
    <xss:complexType>
```

```

<xs:sequence>
    <xs:element ref="characteristic" minOccurs="0" maxOccurs="unbounded" />
</xs:sequence>
<xs:attribute name="version" type="xs:string" />
</xs:complexType>
</xs:element>
<xs:element name="NewDataSet" msdata:IsDataSet="true" msdata:UseCurrentLocale="true">
    <xs:complexType>
        <xs:choice minOccurs="0" maxOccurs="unbounded">
            <xs:element ref="characteristic" />
            <xs:element ref="wap-provisioningdoc" />
        </xs:choice>
    </xs:complexType>
</xs:element>
</xs:schema>

```

3.1.4.1.3 Complex Types

The following table summarizes the XML Schema complex type definitions that are specific to this operation.

ComplexType	Description
WindowsDeviceEnrollmentServiceError	An object returned by the web service when an error occurs.

3.1.4.1.3.1 WindowsDeviceEnrollmentServiceError

Namespace: <http://schemas.datacontract.org/2004/07/Microsoft.DeviceRegistration>

```

<xsd:complexType name="WindowsDeviceEnrollmentServiceError">
    <xsd:sequence>
        <xsd:element minOccurs="0" maxOccurs="1" name="ErrorType" nillable="true"
type="q2:WinDeviceEnrollmentServiceErrorType"/>
        <xsd:element minOccurs="0" maxOccurs="1" name="Message" nillable="true"
type="xsd:string"/>
    </xsd:sequence>
</xsd:complexType>

```

ErrorType: Indicates the type of error that occurred. MUST be a value from the WinDeviceEnrollmentServiceErrorType enumeration (section [3.1.4.1.4.1](#)).

Message: A string that provides details about the specific error that occurred. The content of this string is implementation-specific.

3.1.4.1.4 Simple Types

The following table summarizes the XML Schema simple type definitions that are specific to this operation.

SimpleType	Description
WinDeviceEnrollmentServiceErrorType	An object returned by the web service when an error occurs.

3.1.4.1.4.1 WinDeviceEnrollmentServiceErrorType

An object returned by the web service when an error occurs.

Namespace: <http://schemas.datacontract.org/2004/07/Microsoft.DeviceRegistration>

```
<xsd:simpleType name="WinDeviceEnrollmentServiceErrorType">
  <xsd:restriction base="xsd:string">
    <xsd:enumeration value="InvalidParameter"/>
    <xsd:enumeration value="SqlError"/>
    <xsd:enumeration value="CertificateAuthorityError"/>
    <xsd:enumeration value="DirectoryAccountError"/>
    <xsd:enumeration value="AuthenticationError"/>
    <xsd:enumeration value="AuthorizationError"/>
    <xsd:enumeration value="UnknownError"/>
  </xsd:restriction>
</xsd:simpleType>
```

The following table specifies the allowable values for **WinDeviceEnrollmentServiceErrorType**:

Value	Meaning
InvalidParameter	An invalid parameter was sent to the web service.
SqlError	An error occurred with the database.
CertificateAuthorityError	An error occurred with the Certificate Authority.
DirectoryAccountError	An error occurred with the Directory Service.
AuthenticationError	An error occurred while authenticating the user.
AuthorizationError	An error occurred while authorizing the user.
UnknownError	An unknown error occurred.

3.1.4.2 Processing Rules

An incoming **SOAP message** MUST be processed to evaluate the SOAP actions and authentication information.

If the user has authenticated successfully by using the provided authentication information, message processing MUST continue. If the authentication fails, the server MUST respond with a SOAP fault.

If any other SOAP action is defined, the server MUST respond with a SOAP fault.

3.1.4.2.1 New Request Processing

For this type of message, a server has syntax constraints on the request message.

1. The server MUST check for the <http://schemas.microsoft.com/authorization/claims/PermitDeviceRegistrationClaim> claim in the JWT. If the claim is not present, or if the value of this claim is not TRUE, the server MUST respond with a SOAP fault.

- The server MUST query for all **ms-DS-Device** objects whose **ms-DS-Registered-Users** attribute contains the **SID** of the authenticating user.

The server MUST read the integer value of the **ms-DS-Registration-Quota** attribute of the **ms-DS-Device-Registration-Service** object stored on the directory server.

The server MUST exempt from quota enforcement users who are domain **administrators**.

If the value of the **ms-DS-Registration-Quota** attribute is not zero and the total count of device objects that are registered to the user is greater than the integer stored in the **ms-DS-Registration-Quota** attribute, the server MUST respond with a SOAP fault.

- The server MUST add the following object identifiers (OIDs) and values to the X.509 Certificate Request [\[RFC4211\]](#) contained in the <wsse:BinarySecurityToken> element in the SOAP body of the client request.

OID	Value
1.2.840.113556.1.5.284.2	The server MUST generate a globally unique identifier (GUID) and include it as the value.
1.2.840.113556.1.5.284.3	The objectGuid of the user object ([MS-ADSC] section 2.263) on the directory server that corresponds to the authenticating user.
1.2.840.113556.1.5.284.4	The objectGuid of the domain object ([MS-ADSC] section 2.41) on the directory server.
1.2.840.113556.1.5.284.1	The invocationId ([MS-ADA1] section 2.314) of the nTDSDSA object for the directory server.

- The server MUST sign the request by using the issuer certificate stored in the **ms-DS-Issuer-Certificates** attribute of the **ms-DS-Device-Registration-Service** object with the most recent timestamp (see section [2.3.1](#)). The server MUST use a SHA256WithRSAEncryption signature algorithm and SHA256 hash algorithm.
- The server MUST send a request to the directory server to create a device record as an instance of the **ms-DS-Device** class as a child of the container specified in the **ms-DS-Device-Location** attribute of the **ms-DS-Device-Registration-Service** object.

The device record MUST contain:

- The **GUID** generated by the server in step 3, stored as the **ms-DS-Device-ID** attribute.
- The SHA1 hash of the certificate thumbprint plus certificate public key, stored as the **Alt-Security-Identities** attribute.
- The device type that corresponds to the device type sent in the request (section [3.1.4.1.1.1](#)), stored as the **ms-DS-Device-OS-Type** attribute.
- The device operating system version that corresponds to the device operating system sent in the request (section [3.1.4.1.1.1](#)), stored as the **ms-DS-Device-OS-Version** attribute.
- The SID of the user account that authenticated to the web service, stored as the **ms-DS-Registered-Users** attribute.
- The SID of the user account that authenticated to the web service, stored as the **ms-DS-Registered-Owner** attribute.

- Set the **ms-DS-Is-Enabled** attribute to true.
 - The friendly name of the device that corresponds to the display name sent in the request (section [3.1.4.1.1.1](#)), stored as the **Display-Name** attribute.
6. The server MUST send a SOAP response to the client. See section [3.1.4.1.1.2](#) for details on the response.

3.1.5 Timer Events

StaleDeviceCleanup: (section [3.1.2](#))

If the integer value of the **ms-DS-Maximum-Registration-Inactivity-Period** attribute of the **ms-DS-Device-Registration-Service** is zero, the server MUST stop processing and MUST NOT delete any **ms-DS-Device** objects from the directory.

Otherwise, the server MUST query the directory for all **ms-DS-Device** objects. For each **ms-DS-Device** object, the server MUST calculate the time difference (as a count of days) between the local server **Coordinated Universal Time (UTC)** and the time stored in the **ms-DS-Approximate-Last-Logon-Time-Stamp** attribute of the **ms-DS-Device** object.

If the count (as days) is greater than the integer value of the **ms-DS-Maximum-Registration-Inactivity-Period** attribute of the **ms-DS-Device-Registration-Service** and the local server **UTC** time is greater than the time stored in the **ms-DS-Approximate-Last-Logon-Time-Stamp** attribute of the **ms-DS-Device** object, the server MUST delete the **ms-DS-Device** object.

3.1.6 Other Local Events

None.

4 Protocol Examples

In the following message sequence, the token authentication headers have been included in the message sequences for clarity.

4.1 RequestSecurityToken Request/Response Message Sequence

4.1.1 Client RequestSecurityToken Message

5 Security

5.1 Security Considerations for Implementers

The Device Registration Enrollment Protocol uses HTTPS as a transport. Using Secure Sockets Layer (SSL) server certificate verification ensures that the client is communicating with the real server and closes any possible man-in-the-middle attacks.

The input message uses an OAuth 2.0 JSON Web Token for both authentication and authorization. The server must validate that the security token is signed by a trusted identity provider and is within the token validity period, and that the target audience of the token is the server.

5.2 Index of Security Parameters

Security parameter	Section
wsse:BinarySecurityToken	3.1.4.1.1.1

6 Appendix A: Full WSDL

For ease of implementation, the full WSDL and schema are provided in this appendix.

The MS-DVRE protocol is a profile extension of WS-Trust1.3. As such, some elements are inherited from WS-Trust1.3.

WS-Trust 1.3 WSDL: The full WSDL for WS-Trust can be found at: <http://docs.oasis-open.org/ws-sx/ws-trust/200512/ws-trust-1.3.wsdl>.

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Windows 8.1 operating system
- Windows Server 2012 R2 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

8 Change Tracking

This section identifies changes that were made to the [MS-DVRE] protocol document between the February 2014 and May 2014 releases. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements or functionality.
- The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

- New content added.
- Content updated.
- Content removed.
- New product behavior note added.
- Product behavior note updated.
- Product behavior note removed.
- New protocol syntax added.
- Protocol syntax updated.
- Protocol syntax removed.
- New content added due to protocol revision.
- Content updated due to protocol revision.
- Content removed due to protocol revision.
- New protocol syntax added due to protocol revision.
- Protocol syntax updated due to protocol revision.
- Protocol syntax removed due to protocol revision.

- Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
1.5 Prerequisites/Preconditions	70851 Updated instructions for instantiating and configuring a device registration service object.	Y	Content updated.
1.5 Prerequisites/Preconditions	Changed attribute name from ms-DS-Issuer-Certificates-Public to ms-DS-Issuer-Public-Certificates.	Y	Protocol syntax updated.
2.3 Directory Service Schema Elements	Updated the following attribute names: ms-DS-Approximate-Last-Logon-Time-Stamp, Display-Name, ms-DS-Issuer-Public-Certificates, ms-DS-Is-Enabled.Added ms-DS-Device-Container class.	Y	Content updated.
2.3 Directory Service Schema Elements	70851 Added ms-DS-Device-Container class and ms-DS-Device-Registration-Service class to the table.	Y	Content updated.
2.3.2 ms-DS-Issuer-Public-Certificates	Changed attribute name from ms-DS-Issuer-Certificates-Public to ms-DS-Issuer-Public-Certificates.	Y	Content updated.
2.3.3 Alt-Security-Identities	Updated the description of the Alt-Security-Identities attribute.	Y	Content

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
			updated.
3.1.3 Initialization	Changed ms-DS-IsEnabled to ms-DS-Is-Enabled.	Y	Content updated.
3.1.3 Initialization	70851 Changed ms-DS-Device-Registration-Service-Container to ms-DS-Device-Registration-Service.	Y	Content updated.
3.1.4.1.1.1 IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message	69465 Modified the character case of wst:TokenType.	N	Content updated.
3.1.4.1.1.1 IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message	69459 Moved the WSDL definition so that it is near the beginning of this section.	N	Content updated.
3.1.4.1.1.1 IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message	70731 Updated the EncodingType attribute URL.	Y	Content updated.
3.1.4.1.1.1 IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message	70764 Updated requirements for the certificate request associated with the wsse:BinarySecurityToken element.	Y	Content updated.
3.1.4.1.1.1 IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage Message	70812 Updated to indicate that IWindowsDeviceEnrollmentService_RequestSecurityToken_InputMessage conforms to the RequestSecurityToken syntax described in WS-Trust1.3 Section 3.2.	Y	Protocol syntax updated.
3.1.4.1.1.2 IWindowsDeviceEnrollmentService_RequestSecurityToken	69460 Moved the WSDL definition so that	N	Content

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
n_OutputMessage Message	it is near the beginning of this section.		updated.
3.1.4.1.1.2 IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage Message	70812 Updated to indicate that IWindowsDeviceEnrollmentService_RequestSecurityToken_OutputMessage conforms to the RequestSecurityTokenResponseCollection syntax described in WS-Trust1.3 Section 3.2.	Y	Protocol syntax updated.
3.1.4.1.1.3 IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message	69460 Moved the WSDL definition so that it is near the beginning of this section.	N	Content updated.
3.1.4.1.1.3 IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message	69461 Updated to indicate that error strings and other data contained in a SOAP action value are insignificant to the protocol.	Y	Content updated.
3.1.4.1.1.3 IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message	70728 Updated to indicate that error strings and other data contained in a SOAP action value are insignificant to the protocol.	Y	Content updated.
3.1.4.1.1.3 IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message	70785 Updated to indicate that error strings and other data contained in a SOAP action value are insignificant to the protocol.	Y	Content updated.
3.1.4.1.1.3 IWindowsDeviceEnrollmentService_RequestSecurityToken_WindowsDeviceEnrollmentServiceErrorFault_FaultMessage Message	70877 Specified that the client must disregard the WindowsDeviceEnrollmentServiceError node in the SOAP fault response.	Y	Content updated.
3.1.4.1.2.7 ac:AdditionalContext	70812 Updated the description of the ac:AdditionalContext element.	Y	Content updated.
3.1.4.1.3.1	69462	Y	Content updated.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
WindowsDeviceEnrollmentServiceError	Added descriptions for the ErrorType and Message elements.		tent update d.
3.1.4.1.3.1 WindowsDeviceEnrollmentServiceError	69463 Included a reference to the WinDeviceEnrollmentServiceErrorType enumeration.	N	Content updated.
3.1.4.2.1 New Request Processing	70851 Changed ms-DS-Device-Registration-Service-Container to ms-DS-Device-Registration-Service.	Y	Content updated.
3.1.4.2.1 New Request Processing	69465 Included missing hyphen in "ms-DS-Registered-Users".	N	Content updated.
3.1.4.2.1 New Request Processing	70851 Changed ms-DS-Device-Registration-Service-Container to ms-DS-Device-Registration-Service.	Y	Content updated.
3.1.4.2.1 New Request Processing	Changed ms-DS-Display-Name to Display-Name.	Y	Content updated.
3.1.4.2.1 New Request Processing	70764 Updated to indicate that the server MUST use the SHA256WithRSAEncryption signature algorithm and SHA256 hash algorithm rather than SHA256 signature algorithm.	Y	Content updated.
3.1.4.2.1 New Request Processing	70852 Added the following text: "The server MUST exempt from quota enforcement users who are domain administrators.". Fixed Glossary tag to include "s" at the end of "administrators".	Y	Content updated.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
3.1.5 Timer Events	70851 Changed "ms-DS-Device-Registration-Service-Container" to "ms-DS-Device-Registration-Service".	Y	Content updated.
3.1.5 Timer Events	Changed Approximate-Last-Use-Time-Stamp to Approximate-Last-Logon-Time-Stamp.	Y	Content updated.
4.1.4 Provisioning Document Example	70765 Updated provisioning doc example.	N	Content updated.
6 Appendix A: Full WSDL	70812 Updated to indicate that some elements of the WSDL schema conform to syntax definitions in WS-Trust 1.3.	Y	Protocol syntax updated.
