Table of Contents

1   Introduction

The Windows Error Codes document is a companion reference to the protocol specifications. It documents the common usage details for those HRESULT values, Win32 error codes, and NTSTATUS values that are referenced by specifications in the protocol documentation set.

Sections 1.7 and 2 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in [RFC2119].. All other sections and examples in this specification are informative.

1.1   Glossary

TheThis document uses the following terms are specific to this document:

HRESULT: An integer value that indicates the result or status of an operation. A particular HRESULT can have different meanings depending on the protocol using it. See [MS-ERREF] section 2.1 and specific protocol documents for further details.

message identifier: A string that uniquely identifies an email message.

terminal server: A computer on which **terminal services** is running.

terminal services (TS): A service on a server computer that allows delivery of applications, or the desktop itself, to various computing devices. When a user runs an application on a **terminal server**, the application execution takes place on the server computer and only keyboard, mouse, and display information is transmitted over the network. Each user sees only his or her individual session, which is managed transparently by the server operating system and is independent of any other client session.

universally unique identifier (UUID): A 128-bit value. UUIDs can be used for multiple purposes, from tagging objects with an extremely short lifetime, to reliably identifying very persistent objects in cross-process communication such as client and server interfaces, manager entry-point vectors, and RPC objects. UUIDs are highly likely to be unique. UUIDs are also known as globally unique identifiers (GUIDs) and these terms are used interchangeably in the Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the UUID. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122] or [C706] must be used for generating the UUID.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2   References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1   Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

None.

1.3 Overview

If a protocol returns **HRESULTs**, the protocol uses HRESULTs, as specified in section 2.1.

If a protocol uses Win32 error codes, these values are taken from the Windows error number space, as specified in section 2.2.

If a protocol uses NTSTATUS values, these values are specified in section 2.3.

1.4 Relationship to Protocols and Other Structures

The structures documented in this specification do not depend on any other structures or protocols.

The structures in this document are returned by many protocols.

1.5 Applicability Statement

The data types specified in this document are applicable for use in any protocol that needs to include a discrete set of error codes.

1.6 Versioning and Localization

The structures in the Windows Error Codes require no versioning or localization information.

1.7 Vendor Extensible Fields

HRESULTs: Vendors can choose their own values, as long as the **C** bit (0x20000000) is set, indicating it is a customer code. The structures documented in this specification have no vendor-extensible fields.

Win32 Error Codes: Vendors ~~should~~can only reuse ~~those~~these values with their indicated meanings. Choosing any other value runs the risk of a collision in the future.

NTSTATUS: Vendors can choose their own values for this field, as long as the **C** bit (0x20000000) is set, indicating it is a customer code.

2 Structures

2.1 HRESULT

The HRESULT numbering space is vendor-extensible. Vendors can supply their own values for this field, as long as the **C** bit (0x20000000) is set, indicating it is a customer code.

The HRESULT numbering space has the following internal structure. Any protocol that uses NTSTATUS values on the wire is responsible for stating the order in which the bytes are placed on the wire.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3 0	1
S	R	C	N	X			Facility													Code											

S (1 bit): Severity. If set, indicates a failure result. If clear, indicates a success result.

R (1 bit): Reserved. If the **N** bit is clear, this bit MUST be set to 0. If the **N** bit is set, this bit is defined by the NTSTATUS numbering space (as specified in section 2.3).

C (1 bit): Customer. This bit specifies if the value is customer-defined or Microsoft-defined. The bit is set for customer-defined values and clear for Microsoft-defined values.<1>

N (1 bit): If set, indicates that the error code is an NTSTATUS value (as specified in section 2.3), except that this bit is set.

X (1 bit): Reserved. SHOULD be set to 0. <2>

Facility (11 bits): An indicator of the source of the error. New facilities are occasionally added by Microsoft.

The following table lists the currently defined facility codes:

2.1.1   HRESULT Values

Combining the fields of an HRESULT into a single, 32-bit numbering space, the following HRESULT values are defined, in addition to those derived from NTSTATUS values (section 2.3.1) and Win32 error codes (section 2.2). This document provides the common usage details of the HRESULTs; individual protocol specifications may provide expanded or modified definitions.

Most values also have a default message defined, which can be used to map the value to a human-readable text message; when this is done, the HRESULT value is also known as a **message identifier**.

Note: In the following descriptions, a percentage sign (%) followed by one or more alphanumeric characters (for example, "%1" or "%hs") indicates a variable that is replaced by text at the time the value is returned.

2.1.2 HRESULT From WIN32 Error Code Macro

The HRESULT From WIN32 Error Code Macro converts a Win32 error code to an HRESULT using the pattern 0x8007XXXX, where XXXX is the first two bytes of the Win32 hex value 0x0000XXXX.

The macro is as follows:

```
#define FACILITY_WIN32 0x0007

#define __HRESULT_FROM_WIN32(x) ((HRESULT)(x) <= 0 ? ((HRESULT)(x)) : ((HRESULT) (((x) &
0x0000FFFF) | (FACILITY_WIN32 << 16) | 0x80000000)))
```

2.2 Win32 Error Codes

All Win32 error codes MUST be in the range 0x0000 to 0xFFFF, although Win32 error codes can be used both in 16-bit fields (such as within the HRESULT type specified in section 2.1) as well as 32-bit fields. Most values also have a default message defined, which can be used to map the value to a human-readable text message; when this is done, the Win32 error code is also known as a message identifier.

Vendors SHOULD reuse the values in the The following table with their indicatedspecifies the values and corresponding meanings. Choosing any of the Win32 error codes. Vendors SHOULD NOT assign other value runsmeanings to these values, to avoid the risk of a collision in the future.<3>.

This document provides the common usage details of the Win32 error codes; individual protocol specifications may provide expanded or modified definitions.

Note In the following descriptions, a percentage sign followed by one or more alphanumeric characters (for example, "%1" or "%hs") indicates a variable that will be replaced by text at the time the value is returned.

2.3   NTSTATUS

Values are 32 bit and are laid out as follows. The following diagram is independent of endianness; that is, the diagram is shown in host byte order and merely shows the layout of the numbering space.

Any protocol that uses NTSTATUS values on the wire is responsible for stating the order that the bytes are placed on the wire.

0	1	2	3	4	5	6	7	8	9	1 0	1	2	3	4	5	6	7	8	9	2 0	1	2	3	4	5	6	7	8	9	3 0	1
Sev		C	N	Facility												Code															

Sev (2 bits): Severity. Severity codes are as follows.

Value	Meaning
STATUS_SEVERITY_SUCCESS 0x0	Success
STATUS_SEVERITY_INFORMATIONAL 0x1	Informational
STATUS_SEVERITY_WARNING 0x2	Warning
STATUS_SEVERITY_ERROR 0x3	Error

C (1 bit): Customer. This specifies if the value is customer- or Microsoft-defined. This bit is set for customer-defined values and clear for Microsoft-defined values.<4 3>

N (1 bit): Reserved. MUST be set to 0 so that it is possible to map an NTSTATUS value to an equivalent HRESULT value, as specified in section 2.1, by setting this bit.

Facility (12 bits): A value that, together with the **C** bit, indicates the numbering space to use for the **Code** field.<5 4>

Code (2 bytes): The remainder of the error code. Vendors SHOULD reuse the values in the following table with their indicated meaning or define their own values with the **C** bit set. Choosing any other value with the **C** bit clear runs the risk of a collision in the future.

2.3.1   NTSTATUS valuesValues

By combining the NTSTATUS into a single 32-bit numbering space, the following NTSTATUS values are defined. Most values also have a defined default message that can be used to map the value to a human-readable text message. When this is done, the NTSTATUS value is also known as a message identifier.

This document provides the common usage details of the NTSTATUS values; individual protocol specifications ~~may~~ provide expanded or modified definitions when needed.

In the following descriptions, a percentage sign that is followed by one or more alphanumeric characters (for example, "%1" or "%hs") indicates a variable that is replaced by text at the time the value is returned.

2.4   LDAP Error to Win32 Error Mapping

Windows contains an implementation of the LDAP resultCode ([RFC2251] section 4.1.10) which is used by higher-layer protocols to interpret the results of an LDAP operation.

Each LDAP error value is also mapped to the closest Win32 error value, for use by the higher-layer protocols. This mapping is as shown in the following table:

Value: Decimal	Value: Hexadecimal representation	LDAPResult.resultCode: RFC 1777	LDAPResult.resultCode: RFC 2251	Windows: Ldap Error (LDAP_RETCODE from winldap.w)	Windows: Win32 error (from LdapMapErrorToWin32 / winmain\ds\ds\src\ldap\client\util.cxx)

4   Security Considerations

These structures require no security considerations beyond those of the protocols that utilize them.

5   Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

Note: Some of the information in this section is subject to change because it applies to a preliminary product version, and thus may differ from the final version of the software when released. All behavior notes that pertain to the preliminary product version contain specific references to it as an aid to the reader.

- Windows NT operating system

- Windows 2000 operating system

- Windows XP operating system

- Windows Server 2003 operating system

- Windows Vista operating system

- Windows Server 2008 operating system

- Windows 7 operating system

- Windows Server 2008 R2 operating system

- Windows 8 operating system

- Windows Server 2012 operating system

- Windows 8.1 operating system

- Windows Server 2012 R2 operating system

- Windows 10 operating system

- Windows Server 2016 Technical Preview operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

6 Change Tracking

No table of This section identifies changes is available. Thethat were made to this document is either new or has had no changes since itsthe last release. Changes are classified as New, Major, Minor, Editorial, or No change.

The revision class **New** means that a new document is being released.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

▪ A document revision that incorporates changes to interoperability requirements or functionality.

▪ The removal of a document from the documentation set.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.

The revision class **No change** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the technical content of the document is identical to the last released version.

Major and minor changes can be described further using the following change types:

▪ New content added.

▪ Content updated.

▪ Content removed.

▪ New product behavior note added.

▪ Product behavior note updated.

▪ Product behavior note removed.

▪ New protocol syntax added.

▪ Protocol syntax updated.

▪ Protocol syntax removed.

▪ New content added due to protocol revision.

▪ Content updated due to protocol revision.

▪ Content removed due to protocol revision.

▪ New protocol syntax added due to protocol revision.

▪ Protocol syntax updated due to protocol revision.

▪ Protocol syntax removed due to protocol revision.

▪ Obsolete document removed.

Editorial changes are always classified with the change type **Editorially updated**.

Some important terms used in the change type descriptions are defined as follows:

- **Protocol syntax** refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.

- **Protocol revision** refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N)	Change type
