

[MS-OAPXBC-Diff]:

OAuth 2.0 Protocol Extensions for Broker Clients

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
10/16/2015	1.0	New	Released new document.

1 Introduction

The OAuth 2.0 Protocol Extensions for Broker Clients specify extensions to [RFC6749] (The OAuth 2.0 Authorization Framework) that allow a broker client to obtain access tokens on behalf of calling clients. When no operating system version information is specified, information in this document applies to all relevant versions of Windows. Similarly, when no AD FS behavior level is specified, information in this document applies to all AD FS behavior levels.

In addition to the terms specified in section 1.1, the following terms are used in this document:

From [RFC6749]:

- **access token**
- **access token request**
- **access token response**
- **authorization server**
- **client identifier**
- **confidential client**
- **refresh token**
- **resource owner**

From [OIDCCore]:

- **ID token**

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

Active Directory: A general-purpose network directory service. Active Directory also refers to the Windows implementation of a directory service. Active Directory stores information about a variety of objects in the network. Importantly, user accounts, computer accounts, groups, and all related credential information used by the Windows implementation of Kerberos are stored in Active Directory. Active Directory is either deployed as Active Directory Domain Services (AD DS) or Active Directory Lightweight Directory Services (AD LDS). [MS-ADTS] describes both forms. For more information, see [MS-AUTHSOD] section 1.1.1.5.2, Lightweight Directory Access Protocol (LDAP) versions 2 and 3, Kerberos, and DNS.

Active Directory Domain Services (AD DS): A directory service (DS) implemented by a domain controller (DC). The DS provides a data store for objects that is distributed across multiple DCs. The DCs interoperate as peers to ensure that a local change to an object replicates correctly across DCs. For more information, see [MS-AUTHSOD] section 1.1.1.5.2 and [MS-ADTS]. For information about product versions, see [MS-ADTS] section 1. See also Active Directory.

Active Directory Federation Services (AD FS): A Microsoft implementation of a federation services provider, which provides a security token service (STS) that can issue security tokens to a caller using various protocols such as WS-Trust, WS-Federation, and Security Assertion Markup Language (SAML) version 2.0.

AD FS behavior level: A specification of the functionality available in an AD FS server. Possible values such as AD_FS_BEHAVIOR_LEVEL_1 and AD_FS_BEHAVIOR_LEVEL_2 are described in [MS-OAPX].

AD FS server: See authorization server in [RFC6749].

base64 encoding: A binary-to-text encoding scheme whereby an arbitrary sequence of bytes is converted to a sequence of printable ASCII characters, as described in [RFC4648].

Certificate Management Messages over CMS (CMC): An internet standard for transport mechanisms for CMS [RFC2797].

Cryptographic Message Syntax (CMS): A public standard that defines how to digitally sign, digest, authenticate, or encrypt arbitrary message content, as specified in [RFC3852].

domain controller (DC): The service, running on a server, that implements Active Directory, or the server hosting this service. The service hosts the data store for objects and interoperates with other DCs to ensure that a local change to an object replicates correctly across all DCs. When Active Directory is operating as Active Directory Domain Services (AD DS), the DC contains full NC replicas of the configuration naming context (config NC), schema naming context (schema NC), and one of the domain NCs in its forest. If the AD DS DC is a global catalog server (GC server), it contains partial NC replicas of the remaining domain NCs in its forest. For more information, see [MS-AUTHSOD] section 1.1.1.5.2 and [MS-ADTS]. When Active Directory is operating as Active Directory Lightweight Directory Services (AD LDS), several AD LDS DCs can run on one server. When Active Directory is operating as AD DS, only one AD DS DC can run on one server. However, several AD LDS DCs can coexist with one AD DS DC on one server. The AD LDS DC contains full NC replicas of the config NC and the schema NC in its forest. The domain controller is the server side of Authentication Protocol Domain Support [MS-APDS].

JavaScript Object Notation (JSON): A text-based, data interchange format that is used to transmit structured data, typically in Asynchronous JavaScript + XML (AJAX) web applications, as described in [RFC7159]. The JSON format is based on the structure of ECMAScript (Jscript, JavaScript) objects.

JSON Web Token (JWT): A type of token that includes a set of claims encoded as a JSON object. For more information, see [IETF-DRAFT-JWT].

key: In the registry, a node in the logical tree of the data store.

public key: One of a pair of keys used in public-key cryptography. The public key is distributed freely and published as part of a digital certificate. For an introduction to this concept, see [CRYPTO] section 1.8 and [IEEE1363] section 3.1.

relying party (RP): A web application or service that consumes security tokens issued by a security token service (STS).

Uniform Resource Identifier (URI): A string that identifies a resource. The URI is an addressing mechanism defined in Internet Engineering Task Force (IETF) Uniform Resource Identifier (URI): Generic Syntax [RFC3986].

X.509: An ITU-T standard for public key infrastructure subsequently adapted by the IETF, as specified in [RFC3280].

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.2.2 Informative References

None.

1.3 Overview

Active Directory Federation Services (AD FS) implements parts of the OAuth 2.0 Authorization Framework, as defined in [RFC6749] as well as the extensions described in [MS-OAPX]. In addition to these, AD FS also implements extensions to enable broker clients to retrieve tokens from an authorization server on behalf of other clients. These extensions for broker clients are specified in this document.

Note: Throughout this specification, the fictitious names "client.example.com" and "server.example.com" are used as they are used in [RFC6749].

1.4 Relationship to Other Protocols

The OAuth 2.0 Protocol Extensions for Broker Clients (this document) specify extensions to the industry standard OAuth 2.0 Authorization Framework that is defined in [RFC6749] and the extensions described in [MS-OAPX]. These extensions are therefore dependent on the OAuth 2.0 protocol and the extensions in [MS-OAPX] and use HTTPS [RFC2818] as the underlying transport protocol.

Figure 1: Protocol dependency

1.5 Prerequisites/Preconditions

The OAuth 2.0 Protocol Extensions for Broker Clients define extensions to [RFC6749] and [MS-OAPX]. A prerequisite to implementing the OAuth 2.0 Protocol Extensions is that the REQUIRED parts of [RFC6749] have been implemented on the AD FS server.

These extensions also assume that if the OAuth 2.0 client requests authorization for a particular resource, or relying party, secured by the AD FS server, the client knows the identifier of that resource. These extensions also assume that the OAuth 2.0 client knows its own client identifier and all relevant client authentication information if it is a confidential client.

The client runs on a device for which there is a corresponding msDS-Device object in Active Directory with the following additional requirements:

- The client has access to the private key of a device certificate. The public portion of the device certificate is stored in the altSecurityIdentities attribute of the device's msDS-Device object in Active Directory.
- The client has access to the private key of a session transport key (STK). The public portion of the STK is stored in the msDS-KeyCredentialLink attribute of the device's msDS-Device object in Active Directory.

The OAuth 2.0 Protocol Extensions [MS-OAPX], the OAuth 2.0 Protocol Extensions for Broker Clients (this document), and the OpenID Connect 1.0 Protocol Extensions [MS-OIDCE], if being used, MUST all be running on the same AD FS server.

1.6 Applicability Statement

The OAuth 2.0 Protocol Extensions for Broker Clients are supported by all AD FS servers that are at an AD FS behavior level of AD_FS_BEHAVIOR_LEVEL_2 or higher. See [MS-OAPX] section 3.2.1.1 for the formal definition of AD FS behavior level.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

Supported Transports: The OAuth 2.0 Protocol Extensions for Broker Clients support only HTTPS [RFC2818] as the transport protocol.

Protocol Versions: The OAuth 2.0 Protocol Extensions for Broker Clients do not define protocol versions.

Localization: The OAuth 2.0 Protocol Extensions for Broker Clients do not return localized strings.

Capability Negotiation: The OAuth 2.0 Protocol Extensions for Broker Clients do not support capability negotiation.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

The HTTPS protocol [RFC2818] MUST be used as the transport.

2.2 Common Data Types

2.2.1 HTTP Headers

The messages exchanged in the OAuth 2.0 Protocol Extensions for Broker Clients use the following HTTP headers in addition to the existing set of standard HTTP headers.

Header	Description
x-ms-RefreshTokenCredential	This optional header can be used by the client to specify a primary refresh token when contacting the authorization endpoint.
x-ms-DeviceCredential	This optional header can be used by the client to prove the identity of the device from which the request is sent when contacting the authorization endpoint.

2.2.1.1 x-ms-RefreshTokenCredential

The **x-ms-RefreshTokenCredential** HTTP header is optional and can be specified by the client role of the OAuth 2.0 Protocol Extensions for Broker Clients. This header is used to pass a previously obtained primary refresh token to the authorization endpoint of the AD FS server. The primary refresh token can be used by the server to authenticate the user and the device on which the client runs when processing the authorization request.

The value of the **x-ms-RefreshTokenCredential** HTTP header MUST be a signed JWT. The signed JWT format is defined in [RFC7519]. The format for the **x-ms-RefreshTokenCredential** header is as follows.

```
String = *(%x20-7E)
x-ms-RefreshTokenCredential = String
```

2.2.1.2 x-ms-DeviceCredential

The **x-ms-DeviceCredential** HTTP header is optional and can be specified by the client role of the OAuth 2.0 Protocol Extensions for Broker Clients. This header is used to authenticate the device on which the client is running.

The value of the **x-ms-DeviceCredential** HTTP header MUST be a signed JWT. The signed JWT format is defined in [RFC7519]. The format for the **x-ms-DeviceCredential** header is as follows.

```
String = *(%x20-7E)
x-ms-DeviceCredential = String
```

2.3 Directory Service Schema Elements

This protocol accesses the Directory Service schema classes and attributes that are listed in the following table(s).

For the syntax of <Class> or <Class><Attribute> pairs, refer to one of the following:

- Active Directory Domain Services (AD DS) [MS-ADA1] [MS-ADA2] [MS-ADSC]

Class	Attribute
msDS-Device	altSecurityIdentities msDS-KeyCredentialLink
user	msDS-KeyCredentialLink

3 Protocol Details

3.1 OAuthBrokerExtension Client Details

The client role of the OAuth 2.0 Protocol Extensions for Broker Clients is the initiator of requests for access tokens on behalf of other clients. The client role also stores data that is important to these requests such as a nonce and the primary refresh token.

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

The client role is expected to be aware of the relying party or resource identifier of the resource server if it requests authorization for a particular resource. See [MS-OAPX] section 3.2.5.2.1.1 for information about the *resource* parameter.

The following elements are defined by this protocol:

Client Identifier: An identifier, represented as a string, that uniquely identifies the client to the server.

Nonce: An opaque, base64-encoded value that is provided by the server and used in requests for a primary refresh token.

Primary Refresh Token: A refresh token that the client can exchange for access tokens from the server.

Session Key: A key used to sign access token requests and decrypt access token responses. The client receives this key from the server in the response that is described in section 3.1.5.1.2.2. This key **MUST** be stored in a secure manner.

Device Certificate: An X.509 certificate that represents the device on which the client runs. The client **MUST** have access to the private key. The *altSecurityIdentities* attribute of an *msDS-Device* object in Active Directory is used to store and access the public portion of the certificate.

Session Transport Key: A key used to decrypt the session key. The *msDS-KeyCredentialLink* attribute of an *msDS-Device* object in Active Directory is used to store and access the key. The *msDS-Device* object **MUST** be the same object in Active Directory that contains the public portion of the **Device Certificate**.

User Authentication Key: A key used to authenticate an end user. The *msDS-KeyCredentialLink* attribute of a user object in Active Directory is used to store and access the public portion of the key.

3.1.2 Timers

None.

3.1.3 Initialization

The OAuth 2.0 Protocol Extensions for Broker Clients do not define any special initialization requirements.

3.1.4 Higher-Layer Triggered Events

None.

3.1.5 Message Processing Events and Sequencing Rules

The resources that are accessed and manipulated by this protocol are defined in [RFC6749] and shown below for reference.

Resource	Description
Token endpoint (/token)	For a description, see section 3.2.5.
Authorization endpoint (/authorize)	For a description, see section 3.2.5.

The HTTP responses to all the HTTP methods are defined in corresponding sections of [RFC6749].

3.1.5.1 Token endpoint (/token)

The following HTTP method is allowed to be performed on this resource.

HTTP method	Description
POST	For a description, see section 3.2.5.1.

3.1.5.1.1 POST (Request for Nonce)

This method requests a nonce value from the server that the client then includes in a future request for a primary refresh token, as defined in section 3.1.5.1.2.

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

/token

3.1.5.1.1.1 Request Body

The format of the request is defined in section 3.2.5.1.1.1.

3.1.5.1.1.2 Response Body

The format of the response is defined in section 3.2.5.1.1.2.

3.1.5.1.1.3 Processing Details

The nonce that is received in the response body of this request is stored in the **Nonce** abstract data model element (section 3.1.1). This nonce is used in a future request for a primary refresh token, as defined in section 3.1.5.1.2.

3.1.5.1.2 POST (Request for Primary Refresh Token)

This method requests a primary refresh token that the client can then exchange for access tokens [or user authentication certificates](#), as defined in sections 3.1.5.1.3 [and 3.1.5.1.4](#).

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

/token

3.1.5.1.2.1 Request Body

The format of the request is defined in section 3.2.5.1.2.1.

3.1.5.1.2.2 Response Body

The format of the response is defined in section 3.2.5.1.2.2.

3.1.5.1.2.3 Processing Details

Request processing:

The client uses the **Nonce** abstract data model (ADM) element value (section 3.1.1) that it received from the server in a previous nonce request (section 3.1.5.1.1) to populate the **request_nonce** field of the request.

The client signs the request JSON Web Token (JWT) described in section 3.1.5.1.2.1 using the private key of the **Device Certificate** ADM element (section 3.1.1).

If using user JWT authentication as described in section 3.2.5.1.2.1.2, the client signs the **assertion** JWT using the private key of the **User Authentication Key** ADM element (section 3.1.1), and sets the **kid** field of the **assertion** JWT to the SHA-256 hash (see [FIPS180-2] section 6.2.2) of the public key of the **User Authentication Key** ADM element (section 3.1.1).

Response processing:

The client stores the **refresh_token** field of the response in the **Primary Refresh Token** ADM element (section 3.1.1).

The client decrypts the **session_key_jwe** field of the response by following the process described in [RFC7516] section 5.2 and by using the **Session Transport Key** ADM element (section 3.1.1). The client stores the decrypted key in the **Session Key** ADM element.

3.1.5.1.3 POST (Exchange Primary Refresh Token for Access Token)

This method exchanges a primary refresh token for an access token.

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

/token

3.1.5.1.3.1 Request Body

The format of the request is defined in section 3.2.5.1.3.1.

3.1.5.1.3.2 Response Body

The format of the response is defined in section 3.2.5.1.3.2.

3.1.5.1.3.3 Processing Details

The client first requests a primary refresh token from the server as defined in sections [3.1.5.1.2](#) and 3.2.5.1.2. It then uses the **Primary Refresh Token** ADM element (section 3.1.1) to populate the **refresh_token** field in this request for the access token.

The client derives a signing key from the **Session Key** ADM element (section 3.1.1), the constant label "AzureAD-SecureConversation", and the *ctx* value provided in the JWT header of the request by using the process described in [SP800-108]. The client uses this signing key to sign the request.

3.1.5.1.4 POST (Exchange Primary Refresh Token for User Authentication Certificate)

This method exchanges a primary refresh token for a user authentication certificate.<1>

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

[/token](#)

3.1.5.1.4.1 Request Body

The format of the request is defined in section 3.2.5.1.4.1.

3.1.5.1.4.2 Response Body

The format of the response is defined in section 3.2.5.1.4.2.

3.1.5.1.4.3 Processing Details

When the client obtains the OpenID Provider Metadata from the server ([MS-OIDCE] section 2.2.3.2), it checks for the **capabilities** field. If the field exists in the metadata and includes the value "winhello cert", the client can proceed with this request for a user authentication certificate.

The client first requests a primary refresh token from the server as defined in sections 3.1.5.1.2 and 3.2.5.1.2. It then uses the **Primary Refresh Token** ADM element (section 3.1.1) to populate the **refresh token** field in this request for the user authentication certificate.

The client constructs a base64-encoded PKCS #10 certificate request ([MS-WCCE] section 2.2.2.6.1) using the **User Authentication Key** ADM element (section 3.1.1), and uses it to populate the **csr** field in this request for the user authentication certificate.

In some cases, the client will have previously registered the public portion of the key that is stored in the **User Authentication Key** ADM element (section 3.1.1) via the Key request defined in [MS-KPP] section 3.1.5.1. In those cases, the client might have received a value in the **pctx** field of that response ([MS-KPP] section 3.1.5.1.1.2) and stored it in the **Data Store Information** ADM element of [MS-KPP] section 3.2.1. If this is true, then the client **SHOULD** populate the **pctx** field of this request with that value.

The client derives a signing key from the **Session Key** ADM element (section 3.1.1), the constant label "AzureAD-SecureConversation", and the *ctx* value provided in the JWT header of the request by using the process described in [SP800-108]. The client uses this signing key to sign the request.

3.1.5.2 Authorization endpoint (/authorize)

As defined in [RFC6749] section 3.1 (Authorization Endpoint), the authorization endpoint on the authorization server is used to interact with the resource owner and obtain an authorization grant. The following HTTP method is allowed to be performed on this endpoint.

HTTP method	Description
GET	For a description, see section 3.2.5.2.

3.1.5.2.1 GET

For the syntax and semantics of the GET method, see section 3.2.5.2.1.

The request, response, and processing details are the same as those specified in [MS-OAPX] section 3.1.5.1.1, with the following additions.

3.1.5.2.1.1 Request Body

The format of the request is defined in section 3.2.5.2.1.1.

3.1.5.2.1.2 Response Body

The response body of this method is the same as that specified in [MS-OAPX] section 3.1.5.1.1.2.

3.1.5.2.1.3 Processing Details

The processing details are the same as those specified in [MS-OAPX] section 3.1.5.1.1.3, with the following addition.

If a primary refresh token is available to the client in the **Primary Refresh Token** ADM element (section 3.1.1), the client can choose to include the token in the optional `x-ms-RefreshTokenCredential` HTTP header. The format of the `x-ms-RefreshTokenCredential` HTTP header is a signed JWT as defined in section 2.2.1.1, with the fields described in section 3.2.5.2.1.1.1. The client populates the header as follows:

- The client uses the **Primary Refresh Token** ADM element to populate the required **refresh_token** field of the `x-ms-RefreshTokenCredential` HTTP header.
- The client uses the **Nonce** ADM element value (section 3.1.1) that it received from the server in a previous nonce request (section 3.1.5.1.1) to populate the required **request_nonce** field of the `x-ms-RefreshTokenCredential` HTTP header.

The client derives a signing key from the **Session Key** ADM element (section 3.1.1), the constant label "AzureAD-SecureConversation", and the `ctx` value provided in the JWT header of the request by using the process described in [SP800-108]. The client uses this signing key to sign the JWT.

If a certificate is available to the client in the **Device Certificate** ADM element (section 3.1.1), the client can include the optional `x-ms-DeviceCredential` HTTP header. The format of the `x-ms-DeviceCredential` HTTP header is a signed JWT as defined in section 2.2.1.2, with the fields described in section 3.2.5.2.1.1.2. The client populates the header as follows:

- The client uses the **Nonce** ADM element value (section 3.1.1) that it received from the server in a previous nonce request (section 3.1.5.1.1) to populate the **request_nonce** field of the request.

The client signs the request JWT described in section 3.1.5.1.2.1 using the private key of the **Device Certificate** ADM element.

Note The client can include both the `x-ms-RefreshTokenCredential` HTTP header and the `x-ms-DeviceCredential` HTTP header in a request, but the server ignores the `x-ms-DeviceCredential` HTTP header if the `x-ms-RefreshTokenCredential` HTTP header that is provided is valid.

3.1.6 Timer Events

None.

3.1.7 Other Local Events

None.

3.2 OAuthBrokerExtension Server Details

The server role of the OAuth 2.0 Protocol Extensions for Broker Clients corresponds to the notion of an authorization server as defined in [RFC6749] section 1.1 (Roles). The server role responds to the client's requests for a nonce, a primary refresh token, and access tokens.

3.2.1 Abstract Data Model

None.

3.2.2 Timers

None.

3.2.3 Initialization

The OAuth 2.0 Protocol Extensions for Broker Clients do not define any special initialization requirements.

3.2.4 Higher-Layer Triggered Events

None.

3.2.5 Message Processing Events and Sequencing Rules

The resources accessed and manipulated by this protocol are defined in [RFC6749] and are shown below for reference.

Resource	Description
Token endpoint (/token)	As defined in [RFC6749] section 3.2 (Token Endpoint), the token endpoint on the authorization server is used by an OAuth 2.0 client to obtain an access token by presenting its authorization grant or refresh token.
Authorization endpoint (/authorize)	As defined in [RFC6749] section 3.1 (Authorization Endpoint), the authorization endpoint is used to interact with the resource owner and obtain an authorization grant.

The HTTP responses to all the HTTP methods are defined in corresponding sections of [RFC6749].

3.2.5.1 Token endpoint (/token)

As defined in [RFC6749] section 3.2 (Token Endpoint), the token endpoint on the AD FS server is used by an OAuth 2.0 client to obtain an access token by presenting its authorization grant or refresh token. The following HTTP method is allowed to be performed on this endpoint.

HTTP method	Description
POST	An access token request issued by the OAuth 2.0 client to the token endpoint of the AD FS server in accordance with the requirements of [RFC6749] section 4.1.3 (Access Token Request).

3.2.5.1.1 POST (Request for Nonce)

This method requests a nonce value from the server that the client then includes in a future request for a primary refresh token, as defined in section 3.2.5.1.2.

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

```
/token
```

3.2.5.1.1.1 Request Body

To request a nonce, the client creates and sends the following request body.

```
POST /token HTTP/1.1
Content-Type: application/x-www-form-urlencoded

grant_type=srv_challenge
```

3.2.5.1.1.2 Response Body

The server sends the following response body for this request.

```
HTTP/1.1 200 OK
Cache-Control: no-store
Pragma: no-cache
Content-Type: application/json; charset=UTF-8

{"Nonce":<nonce>}
```

The response contains a JSON object with one element:

Nonce (REQUIRED): An opaque, base64 URL-encoded value ([RFC4648] section 5). Padding is not required ([RFC4648] section 3.2). It is to be used by the client in a future request for a primary refresh token.

3.2.5.1.1.3 Processing Details

Generation of the **Nonce** field of the response is implementation specific, provided that the nonce meets the following requirements:

- The server **MUST** be able to verify that any nonce value received from the client in a request for a primary refresh token (section 3.2.5.1.2) matches a nonce that was previously issued by the server.
- The server **SHOULD** be able to verify that any nonce value received from the client in a request for a primary refresh token matches a nonce that was issued recently (see section 3.2.5.1.2.3).
- The server **SHOULD** use a method that makes it difficult for an attacker to guess valid nonce values.

3.2.5.1.2 POST (Request for Primary Refresh Token)

This method requests a primary refresh token that the client can then exchange for access tokens [or user authentication certificates](#), as defined in sections 3.2.5.1.3 [and 3.2.5.1.4](#).

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

```
/token
```

3.2.5.1.2.1 Request Body

A signed request is passed as a JSON Web Token (JWT), as specified in [OIDCCore] section 6.1. The JWTs are signed either with a device key or session keys.

The format of the signed request is as follows:

```
POST /token HTTP/1.1
Content-Type: application/x-www-form-urlencoded
grant_type=urn:ietf:params:oauth:grant-type:jwt-bearer&request=<signed JWT>
```

The signed JWT format is defined in [RFC7519].

The JWT fields MUST be given the following values:

client_id (REQUIRED): A unique identifier for the broker client. <2>

scope (REQUIRED): MUST contain at least the scopes "aza" and "openid". Additional scopes can be included and follow the format described in [RFC6749] section 3.3.

request_nonce (REQUIRED): A nonce previously obtained from the server by making the request described in section 3.1.5.1.1.

Additionally, the client MUST provide user authentication in the request. The client does this by including the JWT fields from one of the following:

- Section 3.2.5.1.2.1.1 for username and password authentication.
- Section 3.2.5.1.2.1.2 if using a signed JWT for authentication.
- Section 3.2.5.1.2.1.3 if using a previous refresh token for authentication.

The signature header fields MUST be given the following values:

typ (REQUIRED): "JWT"

alg (REQUIRED): "RS256"

x5c (REQUIRED): The certificate used to sign the request, following the format described in [RFC7515] section 4.1.6.

3.2.5.1.2.1.1 Username Password Authentication

If authenticating the user by using username and password, the client includes the following fields in the JWT described in section 3.2.5.1.2.1:

grant_type (REQUIRED): "password"

username (REQUIRED): The username of the user for which the primary refresh token is requested.

password (REQUIRED): The password of the user for which the primary refresh token is requested.

3.2.5.1.2.1.2 User JWT Authentication

If authenticating the user by using a signed JWT, the client includes the following fields in the JWT described in section 3.2.5.1.2.1:

grant_type (REQUIRED): "urn:ietf:params:oauth:grant-type:jwt-bearer"

assertion (REQUIRED): A signed JWT used to authenticate the user.

The JWT fields for the JWT provided in the **assertion** field MUST be given the following values:

iss (REQUIRED): The username of the user for which the primary refresh token is requested.

iat (REQUIRED): See [OIDCCore] section 2.

exp (REQUIRED): See [OIDCCore] section 2.

aud (REQUIRED): The Issuer Identifier ([OIDCCore] section 1.2) of the server that the client is sending the request to.

The signature header fields of the **assertion** field MUST be given the following values:

typ (REQUIRED): "JWT"

alg (REQUIRED): "RS256"

kid (REQUIRED): The identifier for the key used to sign the request.

use (REQUIRED): "ngc"

3.2.5.1.2.1.3 Refresh Token Authentication

If authenticating the user by using a previously obtained refresh token, the client includes the following fields in the JWT described in section 3.2.5.1.2.1:

grant_type (REQUIRED): "refresh_token"

refresh_token (REQUIRED): A refresh token ([RFC6749] section 1.5) that was previously obtained from the server.

3.2.5.1.2.1.4 User Certificate Authentication

If authenticating the user by using a signed JWT, the client includes the following fields in the JWT described in section 3.2.5.1.2.1:

grant_type (REQUIRED): "urn:ietf:params:oauth:grant-type:jwt-bearer"

assertion (REQUIRED): A signed JWT used to authenticate the user based upon a certificate that identifies the user.

The JWT fields for the JWT that is provided in the **assertion** field MUST be given the following values:

iss (REQUIRED): The username of the user for which the primary refresh token is requested.

iat (REQUIRED): See [OIDCCore] section 2.

exp (REQUIRED): See [OIDCCore] section 2.

aud (REQUIRED): The Issuer Identifier ([OIDCCore] section 1.2) of the server that the client is sending the request to.

The signature header fields of the **assertion** field MUST be given the following values:

typ (REQUIRED): "JWT"

alg (REQUIRED): "RS256"

x5c (REQUIRED): The certificate used to sign the request, following the format described in [RFC7515] section 4.1.6.

3.2.5.1.2.2 Response Body

The response to the request is a JSON object with the following fields:

token_type (REQUIRED): The string "pop", indicating that the returned refresh token requires proof of possession.

refresh_token (REQUIRED): A primary refresh token. Like a refresh token described in [RFC6749] section 1.5, this can be used by clients to obtain fresh access tokens. Unlike the refresh tokens described in [RFC6749], the primary refresh token requires additional proof of possession to use as described in section 3.2.5.1.3, and can be used by any client known to the server.

refresh_token_expires_in (REQUIRED): The validity interval for the primary refresh token in seconds, as an integer.

session_key_jwe (REQUIRED): A base64 URL-encoded and encrypted key value. The key is encrypted using the JSON Web Encryption (JWE) standard [RFC7516]. The relevant part of the JWE is the encrypted key section, which the client will use for future signature and decryption operations as described in section 3.1.5.1.3.

id_token (REQUIRED): An ID token for the user that is authenticated in the request, as described in [OIDCCore]. The audience for the ID token, that is, the **aud** field, is the same value given in section 3.2.5.1.2.1 for the **client_id** field. The token does not need to be signed.

3.2.5.1.2.3 Processing Details

After receiving the request, the server verifies the signature of the request and also verifies that the **request_nonce** is a nonce value previously issued by the server as defined in section 3.2.5.1.1. The server SHOULD also verify that the nonce was issued recently. If the signature or nonce are invalid, the server returns the error "invalid_grant" using the format described in [RFC6749] section 5.2.

The server then processes the request as a resource owner password credentials grant (see [RFC6749] section 4.3) using the **client_id** field of the request with the following modifications:

- The server authenticates the user based on the fields of the request:
 - If the request uses username and password authentication as in section 3.2.5.1.2.1.1, the server authenticates the user as in a resource owner password credentials grant ([RFC6749] section 4.3) using the **client_id**, **scope**, and **password** fields of the request.
 - If the request uses user JWT authentication as in section 3.2.5.1.2.1.2, the server processes the request as follows:
 1. The server finds the user object in Active Directory with a user principal name ([MS-ADTS] section 5.1.1.1.1) matching the **iss** field of the **assertion** JWT.
 2. It finds the public key for the signature by finding the value of the msDS-KeyCredentialLink attribute on the user object for which the SHA-256 hash ([FIPS180-2] section 6.2.2) of the attribute value matches the **kid** field of the **assertion** JWT.
 3. The server then verifies the signature of the **assertion** JWT by using the public key that was found in the previous step.
 4. If any of the corresponding objects or values cannot be found or the signature of the **assertion** JWT is not valid, the server returns the "invalid_grant" error using the format described in [RFC6749] section 5.2.
- If the request uses refresh token authentication as in section 3.2.5.1.2.1.3, the server validates the refresh token as in [RFC6749] section 6.

- If the request uses user certificate authentication as in section 3.2.5.1.2.1.4, the server verifies the signature of the **assertion** JWT and authenticates the user for whom the certificate in the **x5c** header field was issued.
- The server uses the response format described in section 3.2.5.1.2.2 for successful responses; error responses are returned as described in [RFC6749] section 5.2.
- If the server requires user interaction at the authorization endpoint ([MS-OAPX] section 3.2.5.1) before processing this request (for example, to give consent or to provide additional authentication), the server returns the `interaction_required` error using the format described in [RFC6749] section 5.2.
- The server does NOT issue an access token.
- The server MUST issue a primary refresh token (in place of a normal refresh token) and include it in the **refresh_token** field of the response.

Note: Primary refresh tokens are opaque to the client. The structure and content of a primary refresh token is implementation-specific. However, it must include information that allows the server to find the associated user in the identity data store that is being used (for example, Active Directory).

- The server MUST include an ID token [OIDCCore] in the **id_token** field response.

The server finds the `msDS-Device` object in Active Directory that has an `altSecurityIdentities` value matching the value of the `x5c` parameter of the request header. The server then populates the **session_key_jwe** field of the response by creating a session key and encrypting it by following the process in [RFC7516] section 5.1 and by using the session transport key found in the `msDS-KeyCredentialLink` attribute of the previously located `msDS-Device` object.

3.2.5.1.3 POST (Exchange Primary Refresh Token for Access Token)

Given the primary refresh token that was obtained in section 3.2.5.1.2, this method requests an access token.

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

```
/token
```

3.2.5.1.3.1 Request Body

A signed request is passed as a JSON Web Token (JWT), as specified in [OIDCCore] section 6.1. The JWTs are signed either with a device key or session keys.

The format of the signed request is as follows:

```
POST /token HTTP/1.1
Content-Type: application/x-www-form-urlencoded
grant_type=urn:ietf:params:oauth:grant-type:jwt-bearer&request=<signed JWT>
```

The signed JWT format is defined in [RFC7519].

The JWT fields MUST be given the following values:

client_id (REQUIRED): The client identifier for the client ([RFC6749] section 1.1) to which an access token is to be issued. If the request is made through a broker client, then this is the client identifier of the client that the broker is acting on behalf of.

scope (REQUIRED): The scope that the client requests for the access token, as defined in [RFC6749] section 3.3. The client MUST include the scope "openid" in the request. If the scope "aza" is included in the request, the server includes a new primary refresh token in the response.

resource (OPTIONAL): The resource for which the access token is requested, as defined in [MS-OAPX] section 2.2.3.

iat (REQUIRED): See [OIDCCore] section 2.

exp (REQUIRED): See [OIDCCore] section 2.

grant_type (REQUIRED): "refresh_token"

refresh_token (REQUIRED): A primary refresh token that was previously received from the server. See section 3.1.5.1.2.

The JWT header fields MUST be given the following values. See [RFC7515] section 4 for field descriptions.

alg (REQUIRED): The supported value is "HS256", which indicates the algorithm used for the signature.

ctx (REQUIRED): The base64-encoded bytes used for signature key derivation.

3.2.5.1.3.2 Response Body

The response format is an encrypted JWT. The encrypted JWT (or JWE) format is described in [RFC7516].

The JWT header fields MUST be given the following values:

alg (REQUIRED): "dir"

enc (REQUIRED): "A256GCM"

ctx (REQUIRED): The base64-encoded binary value used for encryption key derivation.

kid (REQUIRED): "session"

After decryption, the JWT response MUST contain the following elements:

access_token (REQUIRED): An access token for the client. See the *access_token* parameter in [RFC6749] section 5.1.

token_type (REQUIRED): "bearer"

expires_in (REQUIRED): The lifetime, in seconds, of the access token. See the *expires_in* parameter in [RFC6749] section 5.1.

refresh_token (OPTIONAL): The new primary refresh token.

refresh_token_expires_in (OPTIONAL): The lifetime, in seconds, of the primary refresh token returned in the **refresh_token** field of the response.

scope (REQUIRED): The scopes included in the access token.

id_token (OPTIONAL): An ID token for the user that was authenticated in the request, as defined in [OIDCCore]. The audience for the ID token, that is, the **aud** field, is the same value given in section 3.2.5.1.3.1 for the **client_id** field. The token does not need to be signed.

3.2.5.1.3.3 Processing Details

The server verifies that the request was signed by the client with a key derived from the session key previously issued to the client using the process for deriving the signing key described in section 3.1.5.1.3.3. If the signature is invalid, the server returns the error "invalid_grant" using the format described in [RFC6749] section 5.2.

If the *resource* query parameter is invalid or is not found to be registered on the AD FS server, the AD FS server responds to the OAuth 2.0 client according to the requirements of [RFC6749] section 4.1.2.1 (Error Response). The REQUIRED error parameter of the response MUST be set to the *invalid_resource* error code, which is defined in [MS-OAPX] section 2.2.4.1.

The server then issues an access token for the requested resource following the process in [RFC6749] section 6, using the **scope** and **refresh_token** values provided in the request, with the following exceptions:

- The response format is as described in section 3.2.5.1.3.2 for successful responses; error responses are returned as described in [RFC6749] section 5.2.
- If the server requires user interaction at the authorization endpoint ([MS-OAPX] section 3.2.5.1) before processing this request (for example, to give consent or to provide additional authentication), the server returns the *interaction_required* error using the format described in [RFC6749] section 5.2.
- If the scope parameter contains the scope "aza", the server issues a new primary refresh token and sets it in the **refresh_token** field of the response, as well as setting the **refresh_token_expires_in** field to the lifetime of the new primary refresh token if one is enforced.
- The scope of the issued access token is always returned in the **scope** response field, even if it is the same as the scope in the request.
- The server can include an ID token (see [OIDCCore]) in the **id_token** field of the response.

The server encrypts the response using a key that was derived by using the same process as that used for deriving the signing key, as defined in section 3.1.5.1.3.3.

3.2.5.1.4 POST (Exchange Primary Refresh Token for User Authentication Certificate)

Given the primary refresh token that was obtained in section 3.2.5.1.2, this method requests a certificate that can be used to authenticate the user.<4>

This operation is transported by an HTTP **POST** and can be invoked through the following URI:

[/token](#)

3.2.5.1.4.1 Request Body

A signed request is passed as a JSON Web Token (JWT), as specified in [OIDCCore] section 6.1. The JWTs are signed either with a device key or session keys.

The format of the signed request is as follows:

```
POST /token HTTP/1.1  
Content-Type: application/x-www-form-urlencoded  
grant_type=urn:ietf:params:oauth:grant-type:jwt-bearer&request=<signed JWT>
```

The signed JWT format is defined in [RFC7519].

The JWT fields MUST be given the following values:

client_id (REQUIRED): The client identifier for the client ([RFC6749] section 1.1) to which an access token is to be issued. If the request is made through a broker client, then this is the client identifier of the client that the broker is acting on behalf of.

scope (REQUIRED): The scope that the client requests for the access token, as defined in [RFC6749] section 3.3. The client MUST include the scope "winhello_cert" in the request. If the scope "aza" is included in the request, the server includes a new primary refresh token in the response.

resource (REQUIRED): "urn:microsoft:winhello:cert:prov:server"

cert_token_use (REQUIRED): "winhello_cert"

csr_type (REQUIRED): "http://schemas.microsoft.com/windows/pki/2009/01/enrollment#PKCS10"

csr (REQUIRED): A base64-encoded PKCS #10 certificate request, which has been constructed as defined in section 3.1.5.1.4.3.

pctx (OPTIONAL): A value with data-store information, which has been constructed as defined in section 3.1.5.1.4.3.

iat (REQUIRED): See [OIDCCore] section 2.

exp (REQUIRED): See [OIDCCore] section 2.

grant_type (REQUIRED): "refresh_token"

refresh_token (REQUIRED): A primary refresh token that was previously received from the server. See section 3.1.5.1.2.

The JWT header fields MUST be given the following values. See [RFC7515] section 4 for field descriptions.

alg (REQUIRED): The supported value is "HS256", which indicates the algorithm used for the signature.

ctx (REQUIRED): The base64-encoded bytes used for signature key derivation.

3.2.5.1.4.2 Response Body

The response format is an encrypted JWT. The encrypted JWT (or JSON Web Encryption (JWE)) format is described in [RFC7516].

The JWT header fields MUST be given the following values:

alg (REQUIRED): "dir"

enc (REQUIRED): "A256GCM"

ctx (REQUIRED): The base64-encoded binary value used for encryption-key derivation.

kid (REQUIRED): "session"

After decryption, the JWT response MUST contain the following elements:

x5c (REQUIRED): A base64-encoded Cryptographic Message Syntax (CMS) certificate chain or a Certificate Management Messages over CMS (CMC) full PKI response (see [MS-WCCE] section 2.2.2.8) containing a certificate that can be used to authenticate the user.

token_type (REQUIRED): "bearer"

expires_in (REQUIRED): An integer value. See the *expires_in* parameter in [RFC6749] section 5.1. Clients MUST ignore this value.

refresh token (OPTIONAL): The new primary refresh token.

refresh token expires in (OPTIONAL): The lifetime, in seconds, of the primary refresh token returned in the **refresh token** field of the response.

scope (REQUIRED): The scopes that were granted for this request.

id token (REQUIRED): An ID token for the user that was authenticated in the request, as defined in [OIDCCore]. The audience for the ID token, that is, the **aud** field, is the same value given in section 3.2.5.1.4.1 for the **client id** field. The token does not need to be signed.

3.2.5.1.4.3 Processing Details

The server verifies that the request was signed by the client with a key derived from the session key previously issued to the client using the process for deriving the signing key described in section 3.1.5.1.4.3. If the signature is invalid, the server returns the error "invalid_grant" using the format described in [RFC6749] section 5.2.

If the *resource* parameter is invalid, the AD FS server responds to the OAuth 2.0 client according to the requirements of [RFC6749] section 4.1.2.1 (Error Response). The REQUIRED error parameter of the response MUST be set to the invalid_resource error code, which is defined in [MS-OAPX] section 2.2.4.1.

- If the **csr_type** field of the request is not present or is not set to a value of "http://schemas.microsoft.com/windows/pki/2009/01/enrollment#PKCS10", the AD FS server MUST send an error response to the OAuth 2.0 client according to the requirements of [RFC6749] section 5.2 (Error Response). The REQUIRED error parameter of the response MUST be set to invalid_request.
- If the **csr** field of the request is not present or is not a valid base64-encoded PKCS #10 request ([MS-WCCE] section 2.2.2.6.1), the AD FS server MUST send an error response to the OAuth 2.0 client according to the requirements of [RFC6749] section 5.2 (Error Response). The REQUIRED error parameter of the response MUST be set to invalid_request.
- The server validates that the PKCS #10 request in the **csr** field was built using a public key that is registered to the user represented in the **refresh token** field of the request:
 - The server finds the corresponding user object in Active Directory for the user represented in the **refresh token** field of the request. If the client provided a value in the **pctx** field of the request and that value is well-formed and has a valid signature, the server uses the hint provided when choosing a domain controller (DC) to search. The format of the **pctx** value is described in [MS-KPP] section 3.1.5.1.1.2.
 - It checks the values of the msDS-KeyCredentialLink attribute on the user object for any that match the public key provided in the SubjectPublicKeyInfo ([MS-WCCE] section 2.2.2.6.1) portion of the PKCS #10 request provided in the **csr** request field. If no match is found, the server returns the "invalid_request" error using the format described in [RFC6749] section 5.2.

The server then issues an access token for the requested resource following the process in [RFC6749] section 6, using the **scope** and **refresh token** values provided in the request, with the following exceptions:

- The response format is as defined in section 3.2.5.1.4.2 for successful responses; error responses are returned as described in [RFC6749] section 5.2.
- The AD FS server provides a base64-encoded CMS certificate chain or a CMC full PKI response ([MS-WCCE] section 2.2.2.8) in the **x5c** response field. The response that is given in the **x5c** field is created based upon the request in the **csr** request field, as described in [MS-WCCE] section 3.2.1.4.2.1.4.1, with the following exceptions:

- All fields in the original request except for SubjectPublicKeyInfo ([MS-WCCE] section 2.2.2.6.1) are ignored.
- The **Subject** field of the **x5c** response field MUST match the identity that is represented by the refresh token provided in the **refresh token** request field.
- If the server requires user interaction at the authorization endpoint ([MS-OAPX] section 3.2.5.1) before processing this request (for example, to give consent or to provide additional authentication), the server returns the interaction required error using the format described in [RFC6749] section 5.2.
- If the scope parameter contains the scope "aza", the server issues a new primary refresh token and sets it in the **refresh token** field of the response, as well as setting the **refresh token expires in** field to the lifetime of the new primary refresh token if one is enforced.
- The scope of the issued access token is always returned in the **scope** response field, even if it is the same as the scope in the request.
- The server can include an ID token [OIDCCore] in the **id token** field of the response, regardless of whether the client requests the openid scope.

The server encrypts the response using a key that was derived by using the same process as that used for deriving the signing key, as defined in section 3.1.5.1.4.3.

3.2.5.2 Authorization endpoint (/authorize)

As defined in [RFC6749] section 3.1 (Authorization Endpoint), the authorization endpoint on the authorization server is used to interact with the resource owner and obtain an authorization grant. The following HTTP method is allowed to be performed on this endpoint.

HTTP method	Description
GET	An authorization request issued by the OAuth 2.0 client to the authorization endpoint of the AD FS server in accordance with the requirements of [RFC6749] section 4.1.1 (Authorization Request).

3.2.5.2.1 GET

This method is transported by an HTTP **GET**.

The request, response, and processing details of this method are the same as those specified in [MS-OAPX] section 3.2.5.1.1, with the following additions.

3.2.5.2.1.1 Request Body

The request body of this method is the same as that specified in [MS-OAPX] section 3.2.5.1.1.1, with the following addition.

When this method is used in the OAuth 2.0 Protocol Extensions for Broker Clients, the request message for this method can also contain the following optional HTTP headers. The header syntax is defined in section 2.2.1.

Request header	Usage	Value
x-ms-	This optional header can be used by the client to specify a primary refresh token	A JWT containing a primary refresh token that the client has previously

Request header	Usage	Value
RefreshTokenCredential	when contacting the authorization endpoint.	obtained from the AD FS server, formatted as described in section 2.2.1.1.
x-ms-DeviceCredential	This optional header can be used by the client to authenticate the device on which the client is running when contacting the authorization endpoint.	A JWT signed with a device certificate, formatted as described in section 2.2.1.2.

3.2.5.2.1.1.1 x-ms-RefreshTokenCredential HTTP header format

As described in section 2.2.1.1, the **x-ms-RefreshTokenCredential** HTTP header is a signed JWT.

The JWT fields MUST be given the following values:

iat (OPTIONAL): See [OIDCCore] section 2.

refresh_token (REQUIRED): A primary refresh token that was previously received from the server. See section 3.1.5.1.2.

request_nonce (REQUIRED): A nonce previously obtained from the server by making the request described in section 3.1.5.1.1.

The JWT header fields MUST be given the following values:

alg (REQUIRED): The supported value is "HS256", which indicates the algorithm that is used for the signature. See [RFC7515] section 4.

ctx (REQUIRED): The base64-encoded bytes used for signature key derivation.

3.2.5.2.1.1.2 x-ms-DeviceCredential HTTP header format

As described in section 2.2.1.2, the **x-ms-DeviceCredential** HTTP header is a signed JWT.

The JWT fields MUST be given the following values: <5>

grant_type (OPTIONAL): Set to "device_auth" if present.

iss (OPTIONAL): Set to "aad:brokerplugin" if present.

request_nonce (REQUIRED): A nonce previously obtained from the server by making the request described in section 3.1.5.1.1.

The signature header fields MUST be given the following values:

typ (REQUIRED): "JWT"

alg (REQUIRED): "RS256"

x5c (REQUIRED): The certificate used to sign the request, following the format described in [RFC7515] section 4.1.6.

3.2.5.2.1.2 Response Body

The response body of this method is the same as that specified in [MS-OAPX] section 3.2.5.1.1.2.

3.2.5.2.1.3 Processing Details

The processing details are the same as those specified in [MS-OAPX] section 3.2.5.1.1.3, with the following additions.

The AD FS server processes the x-ms-RefreshTokenCredential HTTP header as follows.

1. The AD FS server checks the security policy of the resource owner to verify that user credentials received from a previously issued token can be used to authenticate and authorize users.
2. The server verifies the signature of the header and also verifies that the **request_nonce** is a nonce value previously issued by the server as defined in section 3.2.5.1.1. The server SHOULD<6> also verify that the nonce was issued recently. If the signature or **request_nonce** are invalid, the server ignores the x-ms-RefreshTokenCredential HTTP header; if the x-ms-DeviceCredential HTTP header is present, the client processes it as follows, otherwise it continues processing the request as in [MS-OAPX] section 3.2.5.1.1.3.
3. The AD FS server extracts the primary refresh token from the **refresh_token** field of the x-ms-RefreshTokenCredential HTTP header. If the refresh token provided is a valid primary refresh token that was previously issued by the server, then the AD FS server authenticates the user and device to which the primary refresh token was issued and continues processing the request as in [MS-OAPX] section 3.2.5.1.1.3.

If the AD FS server did not receive a valid x-ms-RefreshTokenCredential HTTP header, then it processes a received x-ms-DeviceCredential HTTP header as follows:

1. The server verifies the signature of the header and also verifies that the **request_nonce** is a nonce value previously issued by the server as defined in section 3.2.5.1.1. The server SHOULD<7> also verify that the nonce was issued recently. If the signature or **request_nonce** are invalid, the server ignores the x-ms-DeviceCredential HTTP header and continues processing the request. If the signature is valid, then the AD FS server authenticates the device and continues processing the request as in [MS-OAPX] section 3.2.5.1.1.3.

3.2.6 Timer Events

None.

3.2.7 Other Local Events

None.

4 Protocol Examples

The following sections show examples of the requests and responses that are defined by the OAuth 2.0 Protocol Extensions for Broker Clients.

Note: Throughout these examples, the fictitious name "server.example.com" is used as it is used in [RFC6749].

Note: Throughout these examples, the HTTP samples line breaks were added and irrelevant fields were removed to enhance readability.

4.1 Obtain a Nonce

The following example shows a request from the broker client to the AD FS server for a nonce (section 3.2.5.1.1.1) and the response from the AD FS server that contains the nonce (section 3.2.5.1.1.2).

Request:

```
POST https://server.example.com/adfs/oauth2/token/
HTTP/1.1
{
  Content-Type=application/x-www-form-urlencoded,
  Host=server.example.com,
  Content-Length=24,
  Expect=[100-continue]
}
grant_type=srv_challenge
```

Response:

```
HTTP/1.1 200 OK
{
  Content-Length=1200,
  Content-Type=application/json;charset=UTF-8
}
{"Nonce":"eyJWZXJza..."}
```

4.2 Obtain a Primary Refresh Token

The following example shows a request from the broker client to the AD FS server for a primary refresh token (section 3.2.5.1.2.1) using the obtained nonce (section 4.1) and the response from the AD FS server that contains the primary refresh token (section 3.2.5.1.2.2).

Request:

```
POST https://server.example.com/adfs/oauth2/token/
HTTP/1.1
{
  Content-Type=application/x-www-form-urlencoded,
  Host=server.example.com,
  Content-Length=4176,
  Expect=[100-continue]
}
MessageOffset:251
grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer
&request=eyJ0eXAiOiJKV1...
```

As described in sections 3.2.5.1.2.1 and 3.2.5.1.2.1.1, the content of the request parameter above is a signed JWT. An example of the raw JWT with header is given below.

```
{
  "typ": "JWT",
  "alg": "RS256",
  "x5c": ["MIIEMzC..."]
}
{
  "client_id": "38aa3b87-a06d-4817-b275-7a316988d93b",
  "scope": "aza openid",
  "grant_type": "password",
  "username": "janedoe@example.com",
  "password": "password",
  "request_nonce": "eyJWZXJza..."
}
```

Response:

```
HTTP/1.1 200 OK
{
  Content-Length: 6123,
  Content-Type: application/json; charset=UTF-8
}
{
  "token_type": "pop",
  "refresh_token": "rghyFlxMq2YQTbE...",
  "refresh_token_expires_in": 604800,
  "session_key_jwe": "eyJlbnMiOiJBMjU2R0NNIi...",
  "id_token": "eyJ0eXAiOiJKV1QiLCJhbGci..."
}
```

4.3 Obtain an Access Token

The following example shows a request from the broker client to the AD FS server for an access token (section 3.2.5.1.3.1) using the obtained primary refresh token (section 4.2) and the response from the AD FS server that contains the access token (section 3.2.5.1.3.2).

Request:

```
POST https://server.example.com/adfs/oauth2/token/
HTTP/1.1
{
  Content-Type: application/x-www-form-urlencoded,
  Host: server.example.com,
  Content-Length: 4630,
  Expect: [100-continue]
}
grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer
&request=eyJhbGciOiJIUz...
```

As described in section 3.2.5.1.3.1, the content of the request parameter above is a signed JWT. An example of the raw JWT with header is given below.

```
{
  "alg": "HS256",
  "ctx": "alusEDoF8fY+3p3EPnLFzBj12DUty00v",
}
{
  "client_id": "s6BhdRkqt3",
}
```

```
"scope":"aza openid",
"resource":"https://resource_server1",
"iat":1443739462,
"exp":1443743062,
"grant_type":"refresh_token",
"refresh_token":"rghyFlxMq2YQTbE..."
}
```

Response:

```
HTTP/1.1 200 OK
{
  Content-Length=8739,
  Content-Type=application/json;charset=UTF-8
}
eyJhbGciOiJka...
```

As described in section 3.2.5.1.3.2, the content of the response above is an encrypted JWT. An example of the decrypted JWT with header is given below.

```
{
  "alg":"dir",
  "enc":"A256GCM",
  "ctx":"alusEDoF8fY+3p3EPnLFzBj12DUty0Ov",
  "kid":"session"
}
{
  "access_token":"eyJ0eXAiOiJKV1QiL...",
  "token_type":"bearer",
  "expires_in":3600,
  "refresh_token":"xWsRetnGYw6T...",
  "refresh_token_expires_in":604800,
  "scope":"profile",
  "id_token":"eyJ0eXAiOiJKV1QiL..."
}
```

4.4 Obtain a User Authentication Certificate

The following example shows a request from the broker client to the AD FS server for a user authentication certificate (section 3.2.5.1.4.1) using the obtained primary refresh token (section 4.2) and the response from the AD FS server that contains the user authentication certificate (section 3.2.5.1.4.2).

Request:

```
POST https://server.example.com/adfs/oauth2/token/
HTTP/1.1
{
  Content-Type=application/x-www-form-urlencoded,
  Host=server.example.com,
  Content-Length=4630,
  Expect=[100-continue]
}
grant_type=urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer
&request=eyJhbGciOiJIUz...
```

As described in section 3.2.5.1.4.1, the content of the request parameter is a signed JWT. The following is an example of the raw JWT with header.

```
{
  "alg": "HS256",
  "ctx": "alusEDoF8fY+3p3EPnLFzBj12DUty00v",
}
{
  "client_id": "s6BhdRkgt3",
  "scope": "aza openid winhello cert",
  "resource": "urn:microsoft:winhello:cert:prov:server",
  "csr_type": "http://schemas.microsoft.com/windows/pki/2009/01/enrollment#PKCS10",
  "cert_token_use": "winhello cert"
  "csr": "MIIEpjCCA44...",
  "iat": 1443739462,
  "exp": 1443743062,
  "grant_type": "refresh token",
  "refresh_token": "rghyFlxMq2YQTbE..."
}
```

Response:

```
HTTP/1.1 200 OK
{
  Content-Length: 8739,
  Content-Type: application/json; charset=UTF-8
}
eyJhbGciOiJka...
```

As described in section 3.2.5.1.4.2, the content of the response is an encrypted JWT. The following is an example of the decrypted JWT with header.

```
{
  "alg": "dir",
  "enc": "A256GCM",
  "ctx": "alusEDoF8fY+3p3EPnLFzBj12DUty00v",
  "kid": "session"
}
{
  "x5c": "MIISwgYJKoZIhvcNAQcCoIIS... ",
  "token type": "bearer",
  "expires in": 3600,
  "refresh token": "xWsRetnGYw6T...",
  "refresh token expires in": 604800,
  "scope": "profile",
  "id token": "eyJ0eXAiOiJKV1..."
}
```

5 Security

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

The terms "earlier" and "later", when used with a product version, refer to either all preceding versions or all subsequent versions, respectively. The term "through" refers to the inclusive range of versions. Applicable Microsoft products are listed chronologically in this section.

The following tables show the relationships between Microsoft product versions or supplemental software and the roles they perform.

Windows Client	OAuthBrokerExtension Client role	OAuthBrokerExtension Server role
Windows 10 v1511 operating system	Yes	No

Windows Server	OAuthBrokerExtension Client role	OAuthBrokerExtension Server role
Windows Server 2016 operating system	Yes	Yes

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> [Section 3.1.5.1.4: The POST \(Exchange Primary Refresh Token for User Authentication Certificate\) method is not supported in Windows 10 v1511 or Windows 10 v1607 operating system. This method is exercised in Windows 10 v1703 operating system and later only if \[MSKB-4022723\] is installed on Windows Server 2016 or if a later version of Windows Server operating system is being used for the server role.](#)

<2> Section 3.2.5.1.2.1: Windows clients use the identifier "38aa3b87-a06d-4817-b275-7a316988d93b" to represent the broker client.

<3> Section 3.2.5.1.2.3: The Windows implementation of the AD FS server verifies that the nonce was issued within the last 10 minutes.

<4> [Section 3.2.5.1.4: The POST \(Exchange Primary Refresh Token for User Authentication Certificate\) method is not supported in Windows Server 2016 without \[MSKB-4022723\] installed.](#)

<5> Section 3.2.5.2.1.1.2: The Windows implementation of the client role supplies the values specified for grant_type and iss, but the Windows implementation of the server role ignores them.

<6> Section 3.2.5.2.1.3: The Windows implementation of the AD FS server verifies that the nonce was issued within the last 10 minutes.

<7> Section 3.2.5.2.1.3: The Windows implementation of the AD FS server verifies that the nonce was issued within the last 10 minutes.

7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
1.2.1 Normative References	Added references for [MS-KPP], [MS-WCCE], and [MSKB-4022723] .	Major
3.1.5.1.2 POST (Request for Primary Refresh Token)	Added reference for user authentication certificates.	Major
3.1.5.1.4 POST (Exchange Primary Refresh Token for User Authentication Certificate)	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method.	Major
3.1.5.1.4.1 Request Body	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method request body.	Major
3.1.5.1.4.2 Response Body	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method response body.	Major
3.1.5.1.4.3 Processing Details	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method processing.	Major
3.2.5.1.2 POST (Request for Primary Refresh Token)	Added reference for user authentication certificates.	Major
3.2.5.1.2.3 Processing Details	Added a note about the structure and content of primary refresh tokens.	Major
3.2.5.1.4 POST (Exchange Primary Refresh Token for User Authentication Certificate)	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method.	Major
3.2.5.1.4.1 Request Body	Added section with content for the POST (Exchange Primary Refresh Token for User Authentication Certificate) method request body.	Major
3.2.5.1.4.2 Response Body	Added section with content for the POST (Exchange	Major
