

[MS-RDPEFS-Diff]:

Remote Desktop Protocol: File System Virtual Channel Extension

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
7/20/2007	0.1	Major	MCPP Milestone 5 Initial Availability
9/28/2007	1.0	Major	Updated and revised the technical content.
10/23/2007	2.0	Major	Updated and revised the technical content.
11/30/2007	2.1	Minor	Clarified the meaning of the technical content.
1/25/2008	2.1.1	Editorial	Changed language and formatting in the technical content.
3/14/2008	2.1.2	Editorial	Changed language and formatting in the technical content.
5/16/2008	2.1.3	Editorial	Changed language and formatting in the technical content.
6/20/2008	2.2	Minor	Clarified the meaning of the technical content.
7/25/2008	3.0	Major	Updated and revised the technical content.
8/29/2008	3.0.1	Editorial	Changed language and formatting in the technical content.
10/24/2008	3.1	Minor	Clarified the meaning of the technical content.
12/5/2008	4.0	Major	Updated and revised the technical content.
1/16/2009	5.0	Major	Updated and revised the technical content.
2/27/2009	6.0	Major	Updated and revised the technical content.
4/10/2009	6.0.1	Editorial	Changed language and formatting in the technical content.
5/22/2009	7.0	Major	Updated and revised the technical content.
7/2/2009	8.0	Major	Updated and revised the technical content.
8/14/2009	9.0	Major	Updated and revised the technical content.
9/25/2009	10.0	Major	Updated and revised the technical content.
11/6/2009	11.0	Major	Updated and revised the technical content.
12/18/2009	12.0	Major	Updated and revised the technical content.
1/29/2010	13.0	Major	Updated and revised the technical content.
3/12/2010	14.0	Major	Updated and revised the technical content.
4/23/2010	14.1	Minor	Clarified the meaning of the technical content.
6/4/2010	15.0	Major	Updated and revised the technical content.
7/16/2010	15.0	None	No changes to the meaning, language, or formatting of the technical content.
8/27/2010	15.0	None	No changes to the meaning, language, or formatting of the technical content.
10/8/2010	15.0	None	No changes to the meaning, language, or formatting of the technical content.

Date	Revision History	Revision Class	Comments
11/19/2010	15.0	None	No changes to the meaning, language, or formatting of the technical content.
1/7/2011	15.0	None	No changes to the meaning, language, or formatting of the technical content.
2/11/2011	16.0	Major	Updated and revised the technical content.
3/25/2011	17.0	Major	Updated and revised the technical content.
5/6/2011	17.0	None	No changes to the meaning, language, or formatting of the technical content.
6/17/2011	17.1	Minor	Clarified the meaning of the technical content.
9/23/2011	17.1	None	No changes to the meaning, language, or formatting of the technical content.
12/16/2011	18.0	Major	Updated and revised the technical content.
3/30/2012	18.0	None	No changes to the meaning, language, or formatting of the technical content.
7/12/2012	19.0	Major	Updated and revised the technical content.
10/25/2012	20.0	Major	Updated and revised the technical content.
1/31/2013	20.0	None	No changes to the meaning, language, or formatting of the technical content.
8/8/2013	21.0	Major	Updated and revised the technical content.
11/14/2013	21.0	None	No changes to the meaning, language, or formatting of the technical content.
2/13/2014	21.0	None	No changes to the meaning, language, or formatting of the technical content.
5/15/2014	21.0	None	No changes to the meaning, language, or formatting of the technical content.
6/30/2015	22.0	Major	Significantly changed the technical content.
10/16/2015	22.0	None	No changes to the meaning, language, or formatting of the technical content.
7/14/2016	23.0	Major	Significantly changed the technical content.
<u>6/1/2017</u>	<u>24.0</u>	<u>Major</u>	<u>Significantly changed the technical content.</u>

1 Introduction

This document specifies the Remote Desktop Protocol: File System Virtual Channel Extension, which runs over a static virtual channel with the name RDPDR. The purpose of this protocol is to redirect access from the server to the client file system.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

ASCII: The American Standard Code for Information Interchange (ASCII) is an 8-bit character-encoding scheme based on the English alphabet. ASCII codes represent text in computers, communications equipment, and other devices that work with text. ASCII refers to a single 8-bit ASCII character or an array of 8-bit ASCII characters with the high bit of each character set to zero.

client: A computer on which the remote procedure call (RPC) client is executing.

device driver: The software that the system uses to communicate with a device such as a display, printer, mouse, or communications adapter. An abstraction layer that restricts access of applications to various hardware devices on a given computer system. It is often referred to simply as a "driver".

file system (device) driver: A software abstraction layer that restricts access of applications to the nonvolatile storage hardware on a given computer system.

file system control (FSCTL): A command issued to a file system to alter or query the behavior of the file system and/or set or query metadata that is associated with a particular file or with the file system itself.

protocol data unit (PDU): Information that is delivered as a unit among peer entities of a network and that may contain control information, address information, or data. For more information on remote procedure call (RPC)-specific PDUs, see [C706] section 12.

server: A computer on which the remote procedure call (RPC) server is executing.

Server Message Block (SMB): A protocol that is used to request file and print services from server systems over a network. The SMB protocol extends the CIFS protocol with additional security, file, and disk management support. For more information, see [CIFS] and [MS-SMB].

static virtual channel: A static transport used for lossless communication between a client component and a server component over a main data connection, as specified in [MS-RDPBCGR].

Unicode character: Unless otherwise specified, a 16-bit UTF-16 code unit.

Unicode string: A Unicode 8-bit string is an ordered sequence of 8-bit units, a Unicode 16-bit string is an ordered sequence of 16-bit code units, and a Unicode 32-bit string is an ordered sequence of 32-bit code units. In some cases, it could be acceptable not to terminate with a terminating null character. Unless otherwise specified, all Unicode strings follow the UTF-16LE encoding scheme with no Byte Order Mark (BOM).

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

In a typical terminal server scenario, many of the nonvolatile resources used by the terminal server user (such as hard drives, flash drives, and floppy disks) are located on the client. The server exposes a file system driver that is visible to server-based applications as a hard drive, which allows the applications to access the client file systems.

The Remote Desktop Protocol: File System Virtual Channel Extension allows access between the server and the client file system drivers by redirecting all input/output requests and responses between the two. This protocol is also used as a base for some non-file system drivers (section 1.4).

1.3.1 Protocol Initialization

The following figure shows the initial packet sequence that initializes the protocol. The sequence of messages complies with the following set of rules. The first packet exchange, Server Announce Request/Client Announce Reply, simply consists of the client and server sides of the protocol exchanging version information that tells each side to which version it is speaking. The client sends a Client Name Request after sending a Client Announce Reply message. The Client Name Request contains a friendly display name for the client machine.

The next exchange, Server Core Capability Request/Client Core Capability Response, is used to exchange capabilities between the client and the server to ensure that each side records what kinds of packets are supported by the remote side.

After sending its Server Core Capability Request message, the server also sends a Server Client ID Confirm message confirming the client ID that was exchanged in the Server Announce Request/Client Announce Reply sequence.

The last initialization message sequence is initiated by the client with the Client Device List Announce Request. This packet contains information for each device that is redirected. The packet contains all redirected devices, including non-file system devices. For example, it includes the list of printers (as specified in [MS-RDPEPC]), ports (as specified in [MS-RDPESP]), and smart cards (as specified in [MS-RDPESC]). Each client device is initialized separately. The server sends a Server Device Announce Response message that indicates success or failure for that initialization.

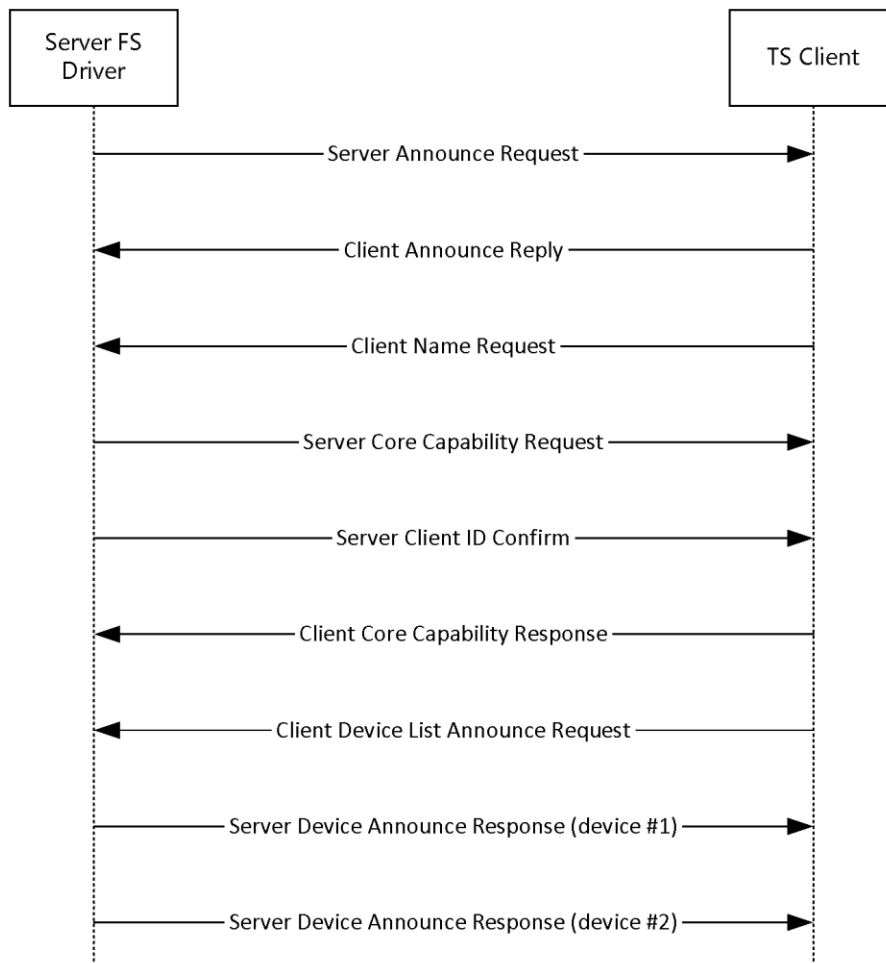

Figure 1: Protocol initialization

In general, there is no distinguishable difference between the initial connection of the protocol and subsequent reconnections. After every disconnection, the protocol is torn down and completely re-initialized on the next connection. However, there is one difference in the protocol initialization sequence upon reconnection: if a user is already logged on, the server sends a Server User Logged On message according to the rules specified in section 3.3.5.1.5.

1.3.2 Drive Redirection

Drives can be announced or deleted at any point in time after the connection has been established. For example, Drive redirection sequence shows the sequence for adding and removing a file system drive. The first message pair, Client Device List Announce Request/Server Device Announce Response, is optional. If the device has been announced already in the Client Device List Announce as part of the protocol initialization, this pair is not required. But if the device has been discovered on the client after the initial sequence, this pair of messages is used to announce the device to the server. The client announces only one drive at a time in this case.

The next pair of messages describes a series of I/O request messages exchanged between the client and the server. This set of messages describes the actual file system functionality redirection. Finally, the Client Drive Device List Remove message announces to the server that the file system drive has been removed from the client, and that all I/O to that device will fail in the future.

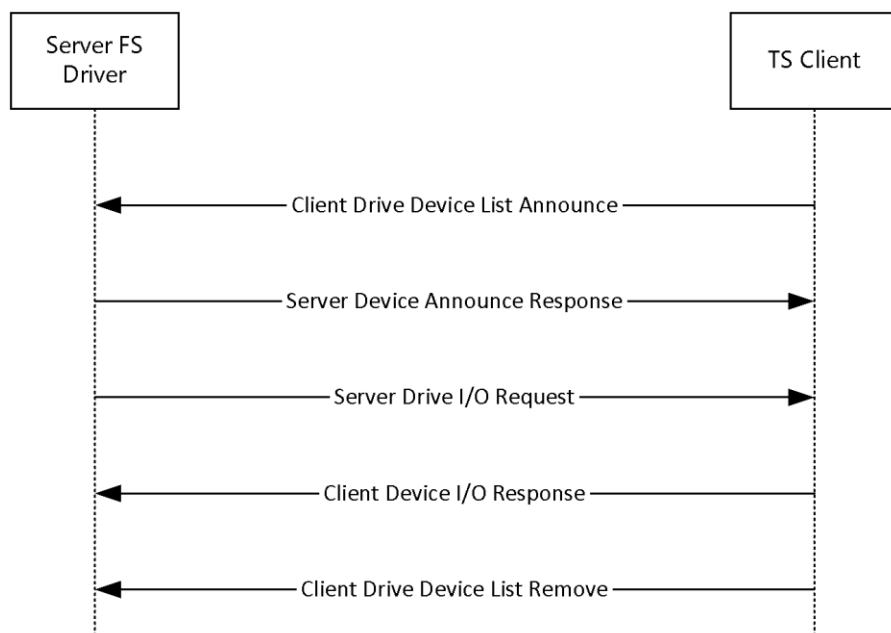

Figure 2: Drive redirection sequence

1.4 Relationship to Other Protocols

The Remote Desktop Protocol: File System Virtual Channel Extension is embedded in a static virtual channel transport, as specified in [MS-RDPBCGR].

Some of the packets described in this protocol are used by the Remote Desktop protocols for printers (as specified in [MS-RDPEPC]), ports (as specified in [MS-RDPESP]), and smart cards (as specified in [MS-RDPESC]).

Note Some of the structures in this protocol are mapped to Server Message Block (SMB2) protocol structures. However, there are no protocol messages or processing that depend on SMB2. See [MS-SMB2] for more information about the SMB2 protocol.

1.5 Prerequisites/Preconditions

The Remote Desktop Protocol: File System Virtual Channel Extension operates only after the static virtual channel transport (as specified in [MS-RDPBCGR]) is fully established. If the static virtual channel transport is terminated, no other communication over the Remote Desktop Protocol: File System Virtual Channel Extension occurs.

1.6 Applicability Statement

The Remote Desktop Protocol: File System Virtual Channel Extension is designed to be run within the context of a Remote Desktop Protocol virtual channel established between a client and a server. This protocol extension is applicable when applications running on the terminal server access the file system physically located on a client machine.

1.7 Versioning and Capability Negotiation

The version numbers for the client and the server are sent in the Server Announce Request (section 2.2.2.2) and Client Announce Reply (section 2.2.2.3) messages. These messages are the first to be exchanged after the static virtual channel transport is established.

The capabilities are sent in separate messages: the Server Core Capability Request (section 2.2.2.7) for the server and the Client Core Capability Response (section 2.2.2.8) for the client. Both messages have a similar structure, and are a combination of capabilities for each feature that will be transported by the static virtual channel. If a feature does not have a capability subpacket, that feature is not supported by the remote side. The following figure shows the structure of a combined capabilities message.

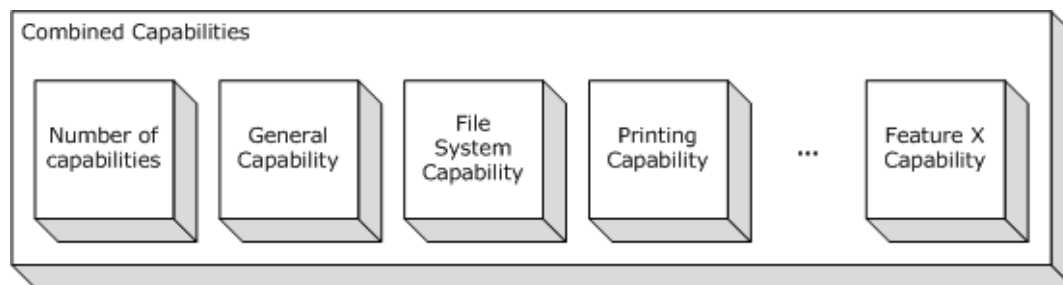

Figure 3: Combined capabilities

The first part of this message is a header that describes the number of capabilities in the message. After the header, an array of capabilities follows, each one of which has a common Capability header (section 2.2.1.2); this header describes the type of the capability and its length. The content of the capability depends on its type.

1.8 Vendor-Extensible Fields

This protocol uses NTSTATUS values, as defined in [MS-ERREF] (section 2.3). Vendors are free to choose their own values for this field, as long as the C-bit (0x20000000) is set, indicating that it is a customer code.

1.9 Standards Assignments

This protocol contains no standards assignments.

2 Messages

The following sections specify how Remote Desktop Protocol: File System Virtual Channel Extension messages are transported and Remote Desktop Protocol: File System Virtual Channel Extension message syntax.

2.1 Transport

This protocol runs over a static virtual channel with the null-terminated ANSI encoded name "RDPDR".<1> Static virtual channels are defined in [MS-RDPBCGR] section 3.1.5.2.

2.2 Message Syntax

The following sections describe Remote Desktop Protocol: File System Virtual Channel Extension message syntax.

2.2.1 Common Data Types

2.2.1.1 Shared Header (RDPDR_HEADER)

This header is present at the beginning of every message in this protocol. The purpose of this header is to describe the type of the message.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Component																PacketId															

Component (2 bytes): A 16-bit unsigned integer that identifies the component to which the packet is sent. This field **MUST** be set to one of the following values.

Value	Meaning
RDPDR_CTYP_CORE 0x4472	Device redirector core component; most of the packets in this protocol are sent under this component ID.
RDPDR_CTYP_PRN 0x5052	Printing component. The packets that use this ID are typically about printer cache management and identifying XPS printers.

PacketId (2 bytes): A 16-bit unsigned integer. The **PacketId** field is a unique ID that identifies the packet function. This field **MUST** be set to one of the following values.

Value	Meaning
PAKID_CORE_SERVER_ANNOUNCE 0x496E	Server Announce Request, as specified in section 2.2.2.2.
PAKID_CORE_CLIENTID_CONFIRM 0x4343	Client Announce Reply and Server Client ID Confirm, as specified in sections 2.2.2.3 and 2.2.2.6.
PAKID_CORE_CLIENT_NAME 0x434E	Client Name Request, as specified in section 2.2.2.4.
PAKID_CORE_DEVICELIST_ANNOUNCE	Client Device List Announce Request, as specified in section

Value	Meaning
0x4441	2.2.2.9.
PAKID_CORE_DEVICE_REPLY 0x6472	Server Device Announce Response, as specified in section 2.2.2.1.
PAKID_CORE_DEVICE_IOREQUEST 0x4952	Device I/O Request, as specified in section 2.2.1.4.
PAKID_CORE_DEVICE_IOCOMPLETION 0x4943	Device I/O Response, as specified in section 2.2.1.5.
PAKID_CORE_SERVER_CAPABILITY 0x5350	Server Core Capability Request, as specified in section 2.2.2.7.
PAKID_CORE_CLIENT_CAPABILITY 0x4350	Client Core Capability Response, as specified in section 2.2.2.8.
PAKID_CORE_DEVICELIST_REMOVE 0x444D	Client Drive Device List Remove, as specified in section 2.2.3.2.
PAKID_PRN_CACHE_DATA 0x5043	Add Printer Cachedata, as specified in [MS-RDPEPC] section 2.2.2.3.
PAKID_CORE_USER_LOGGEDON 0x554C	Server User Logged On, as specified in section 2.2.2.5.
PAKID_PRN_USING_XPS 0x5543	Server Printer Set XPS Mode, as specified in [MS-RDPEPC] section 2.2.2.2.

2.2.1.2 Capability Header (CAPABILITY_HEADER)

This is a header that is embedded in the Server Core Capability Request and Client Core Capability Response. The purpose of this header is to describe capabilities for different device types.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1		
CapabilityType																CapabilityLength																	
Version																																	

CapabilityType (2 bytes): A 16-bit unsigned integer that identifies the type of capability being described. It MUST be set to one of the following values.

Value	Meaning
CAP_GENERAL_TYPE 0x0001	General capability set (GENERAL_CAPS_SET)
CAP_PRINTER_TYPE 0x0002	Print capability set (PRINTER_CAPS_SET)
CAP_PORT_TYPE	Port capability set (PORT_CAPS_SET)

Value	Meaning
0x0003	
CAP_DRIVE_TYPE 0x0004	Drive capability set (DRIVE_CAPS_SET)
CAP_SMARTCARD_TYPE 0x0005	Smart card capability set (SMARTCARD_CAPS_SET)<2>

CapabilityLength (2 bytes): A 16-bit unsigned integer that specifies that size, in bytes, of the capability message, this header included.

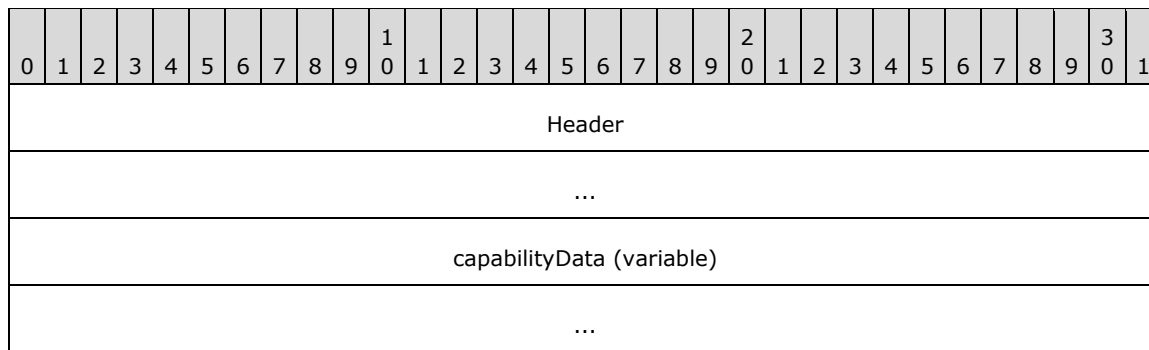

Version (4 bytes): A 32-bit unsigned integer that specifies the capability-specific version for the specific value of **CapabilityType**, as described in the table that follows.

CapabilityType Value	Version Value(s)	Meaning
CAP_GENERAL_TYPE	GENERAL_CAPABILITY_VERSION_01 0x00000001 GENERAL_CAPABILITY_VERSION_02 0x00000002	See section 2.2.2.7.1.
CAP_PRINTER_TYPE	PRINT_CAPABILITY_VERSION_01 0x00000001	Version 1 of printing capabilities.
CAP_PORT_TYPE	PORT_CAPABILITY_VERSION_01 0x00000001	Version 1 of port capabilities.
CAP_DRIVE_TYPE	DRIVE_CAPABILITY_VERSION_01 0x00000001 DRIVE_CAPABILITY_VERSION_02 0x00000002	If the client supports DRIVE_CAPABILITY_VERSION_02, then the drive name of the redirected device can be specified by the DeviceData field of a DEVICE ANNOUNCE header, as specified in the DeviceAnnounce field description of the Client Device List Announce message (section 2.2.3.1).
CAP_SMARTCARD_TYPE	SMARTCARD_CAPABILITY_VERSION_01 0x00000001	Version 1 of smart card capabilities.

2.2.1.2.1 Capability Message (CAPABILITY_SET)

The CAPABILITY_SET structure is used to describe the type, size, and version of a capability set exchanged between clients and servers. All Capability Messages conform to this basic structure. The Capability Message is embedded in the Server Core Capability Request and Client Core Capability Response messages.

Capability Messages are ordered as an array of CAPABILITY_SET structures contained in a Server Core Capability Request or Client Core Capability Response message; however, the presence of a Capability Message is non-compulsory. If **CapabilityMessage** data is not present in a Server Core Capability Request or Client Core Capability Response packet, it is assumed that all fields of the Capability Message are set to zero, with exception of the **CapabilityType** and **CapabilityLength** fields of the Header.

Header (8 bytes): A CAPABILITY_HEADER structure. The **CapabilityType** field of the CAPABILITY_HEADER specifies the format of the data in the **capabilityData** field.

capabilityData (variable): Capability set data that conforms to the structure of the type specified by the **CapabilityType** field of the CAPABILITY_HEADER.

2.2.1.3 Device Announce Header (DEVICE_ANNOUNCE)

This header is embedded in the Client Device List Announce message. Its purpose is to describe different types of devices.

DeviceType (4 bytes): A 32-bit unsigned integer that identifies the device type. This field **MUST** be set to one of the following values.

Value	Meaning
RDPDR_DTYP_SERIAL 0x00000001	Serial port device
RDPDR_DTYP_PARALLEL 0x00000002	Parallel port device
RDPDR_DTYP_PRINT 0x00000004	Printer device

Value	Meaning
RDPDR_DTYP_FILESYSTEM 0x00000008<3>	File system device
RDPDR_DTYP_SMARTCARD 0x00000020<4>	Smart card device

DeviceId (4 bytes): A 32-bit unsigned integer that specifies a unique ID that identifies the announced device. This ID MUST be reused if the device is removed by means of the Client Drive Device List Remove packet specified in section 2.2.3.2.

PreferredDosName (8 bytes): A string of ASCII characters (with a maximum length of eight characters) that ~~represent~~**represents** the name of the device as it appears on the client. This field MUST ~~not~~ be null-terminated ~~if, so~~ the **maximum** device name is **87** characters long. The following characters are considered invalid for the **PreferredDosName** field:

<, >, ", /, \, |

If any of these characters are present, the DR_CORE_DEVICE_ANNOUNC_RSP packet for this device (section 2.2.2.1) will be sent with STATUS_ACCESS_DENIED set in the **ResultCode** field.

If **DeviceType** is set to RDPDR_DTYP_SMARTCARD, the **PreferredDosName** MUST be set to "SCARD".

Note A colon character, ":", is valid only when present at the end of the **PreferredDosName** field, otherwise it is also considered invalid.

DeviceDataLength (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **DeviceData** field.

DeviceData (variable): A variable-length byte array whose size is specified by the **DeviceDataLength** field. The content depends on the **DeviceType** field. See [MS-RDPEPC] section 2.2.2.1 for the printer device type. See [MS-RDPESP] section 2.2.2.1 for the serial and parallel port device types. See section 2.2.3.1 of this protocol for the file system device type. For a smart card device, the **DeviceDataLength** field MUST be set to zero. See [MS-RDPESC] for details about the smart card device type.

2.2.1.4 Device I/O Request (DR_DEVICE_IOREQUEST)

This header is embedded in all server requests on a specific device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
DeviceId																															
FileId																															
CompletionId																															
MajorFunction																															
MinorFunction																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICE_IOREQUEST.

DeviceId (4 bytes): A 32-bit unsigned integer that is a unique ID. The value MUST match the **DeviceId** value in the Client Device List Announce Request (section 2.2.2.9).

FileId (4 bytes): A 32-bit unsigned integer that specifies a unique ID retrieved from the Device Create Response (section 2.2.1.5.1).

CompletionId (4 bytes): A 32-bit unsigned integer that specifies a unique ID for each request. The ID is considered valid until a Device I/O Response (section 2.2.1.5) is received. Subsequently, the ID MUST be reused.

MajorFunction (4 bytes): A 32-bit unsigned integer that identifies the request function. This field MUST have one of the following values.

Value	Meaning
IRP_MJ_CREATE 0x00000000	Create request
IRP_MJ_CLOSE 0x00000002	Close request
IRP_MJ_READ 0x00000003	Read request
IRP_MJ_WRITE 0x00000004	Write request
IRP_MJ_DEVICE_CONTROL 0x0000000E	Device control request
IRP_MJ_QUERY_VOLUME_INFORMATION 0x0000000A	Query volume information request
IRP_MJ_SET_VOLUME_INFORMATION 0x0000000B	Set volume information request
IRP_MJ_QUERY_INFORMATION 0x00000005	Query information request
IRP_MJ_SET_INFORMATION 0x00000006	Set information request
IRP_MJ_DIRECTORY_CONTROL 0x0000000C	Directory control request
IRP_MJ_LOCK_CONTROL 0x00000011	File lock control request

MinorFunction (4 bytes): A 32-bit unsigned integer. This field is valid only when the **MajorFunction** field is set to IRP_MJ_DIRECTORY_CONTROL. If the **MajorFunction** field is set to another value, the **MinorFunction** field value SHOULD be 0x00000000; <5> otherwise, the **MinorFunction** field MUST have one of the following values.

Value	Meaning
IRP_MN_QUERY_DIRECTORY	Query directory request

Value	Meaning
0x00000001	
IRP_MN_NOTIFY_CHANGE_DIRECTORY 0x00000002	Notify change directory request

2.2.1.4.1 Device Create Request (DR_CREATE_REQ)

This header initiates a create request. This message can have different purposes depending on the device for which it is issued. The device type is determined by the **DeviceId** field in the DR_DEVICE_IOREQUEST header.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
DesiredAccess																															
AllocationSize																															
...																															
FileAttributes																															
SharedAccess																															
CreateDisposition																															
CreateOptions																															
PathLength																															
Path (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST header. The **MajorFunction** field in this header MUST be set to IRP_MJ_CREATE.

DesiredAccess (4 bytes): A 32-bit unsigned integer that specifies the level of access. This field is specified in [MS-SMB2] section 2.2.13.

AllocationSize (8 bytes): A 64-bit unsigned integer that specifies the initial allocation size for the file.

FileAttributes (4 bytes): A 32-bit unsigned integer that specifies the attributes for the file being created. This field is specified in [MS-SMB2] section 2.2.13.

SharedAccess (4 bytes): A 32-bit unsigned integer that specifies the sharing mode for the file being opened. This field is specified in [MS-SMB2] section 2.2.13.

CreateDisposition (4 bytes): A 32-bit unsigned integer that specifies the action for the client to take if the file already exists. This field is specified in [MS-SMB2] section 2.2.13. For ports and other devices, this field MUST be set to FILE_OPEN (0x00000001).

CreateOptions (4 bytes): A 32-bit unsigned integer that specifies the options for creating the file. This field is specified in [MS-SMB2] section 2.2.13.

PathLength (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Path** field, including the null-terminator.

Path (variable): A variable-length array of Unicode characters, including the null-terminator, whose size is specified by the **PathLength** field. The protocol imposes no limitations on the characters used in this field.

2.2.1.4.2 Device Close Request (DR_CLOSE_REQ)

This header initiates a close request. This message can have different purposes depending on the device for which it is issued. The device type is determined by the **DeviceId** field in the DR_DEVICE_IOREQUEST header.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
Padding (32 bytes)																															
...																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST header. The **MajorFunction** field in this header MUST be set to IRP_MJ_CLOSE.

Padding (32 bytes): An array of 32 bytes. Reserved. This field can be set to any value, and MUST be ignored.

2.2.1.4.3 Device Read Request (DR_READ_REQ)

This header initiates a read request. This message can have different purposes depending on the device for which it is issued. The device type is determined by the **DeviceId** field in the DR_DEVICE_IOREQUEST header.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
Length																															
Offset																															
...																															
Padding (20 bytes)																															
...																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST header. The **MajorFunction** field in this header MUST be set to IRP_MJ_READ.

Length (4 bytes): A 32-bit unsigned integer. This field specifies the maximum number of bytes to be read from the device.

Offset (8 bytes): A 64-bit unsigned integer. This field specifies the file offset where the read operation is performed.

Padding (20 bytes): An array of 20 bytes. Reserved. This field can be set to any value and MUST be ignored.

2.2.1.4.4 Device Write Request (DR_WRITE_REQ)

This header initiates a write request. This message can have different purposes depending on the device for which it is issued. The device type is determined by the **DeviceId** field in the DR_DEVICE_IOREQUEST header.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
Length																															
Offset																															
...																															

Padding (20 bytes)
...
...
WriteData (variable)
...

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST header. The **MajorFunction** field in this header MUST be set to IRP_MJ_WRITE.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **WriteData** field.

Offset (8 bytes): A 64-bit unsigned integer. This field specifies the file offset at which the data MUST be written. If the client advertised a minor version of at least 0x000D in the Client Announce Reply (section 2.2.2.3), then a value of 0xFFFFFFFFFFFFFFFF indicates that the client MUST treat this write request as an append operation.<6>

Padding (20 bytes): An array of 20 bytes. Reserved. This field can be set to any value and MUST be ignored.

WriteData (variable): A variable-length array of bytes, where the length is specified by the **Length** field in this packet. This array contains data to be written on the target device.

2.2.1.4.5 Device Control Request (DR_CONTROL_REQ)

This header initiates a device control request. This message can have different purposes depending on the device for which it is issued. The device type is determined by the **DeviceId** field in the DR_DEVICE_IOREQUEST header.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
OutputBufferLength																															
InputBufferLength																															
IoControlCode																															
Padding (20 bytes)																															
...																															
...																															

InputBuffer (variable)
...

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST header. The **MajorFunction** field in this header MUST be set to IRP_MJ_DEVICE_CONTROL.

OutputBufferLength (4 bytes): A 32-bit unsigned integer that specifies the maximum number of bytes expected in the **OutputBuffer** field of the Device Control Response (section 2.2.1.5.5).

InputBufferLength (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **InputBuffer** field.

IoControlCode (4 bytes): A 32-bit unsigned integer. This field is specific to the redirected device.

Padding (20 bytes): An array of 20 bytes. Reserved. This field can be set to any value and MUST be ignored.

InputBuffer (variable): A variable-size byte array whose size is specified by the **InputBufferLength** field.

2.2.1.5 Device I/O Response (DR_DEVICE_IOCOMPLETION)

A message with this header indicates that the I/O request is complete. In a Device I/O Response message, a request message is matched to the Device I/O Request (section 2.2.1.4) header based on the **CompletionId** field value. There is only one response per request.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
DeviceId																															
CompletionId																															
IoStatus																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICE_IOCOMPLETION.

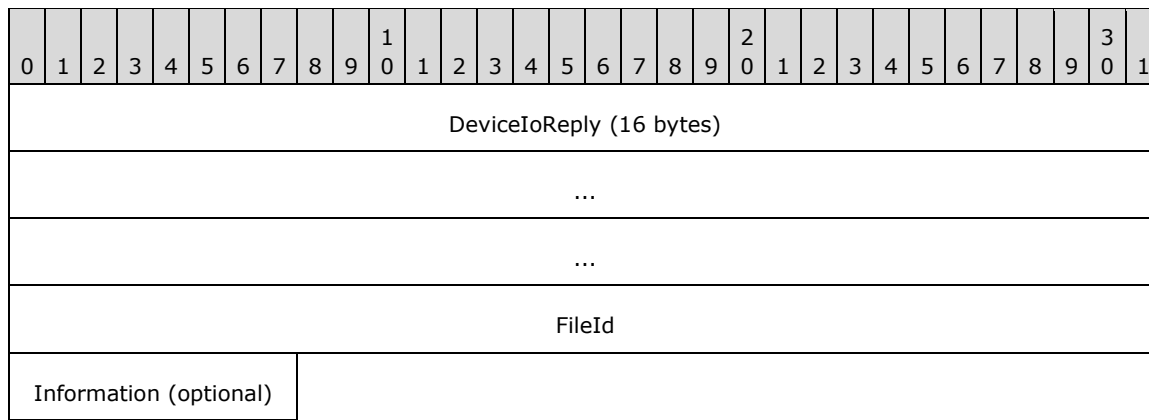

DeviceId (4 bytes): A 32-bit unsigned integer. This field MUST match the **DeviceId** field in the DR_DEVICE_IOREQUEST header for the corresponding request.

CompletionId (4 bytes): A 32-bit unsigned integer. This field MUST match the **CompletionId** field in the DR_DEVICE_IOREQUEST header for the corresponding request. After processing a response packet with this ID, the same ID MUST be reused in another request.

IoStatus (4 bytes): A 32-bit unsigned integer that specifies the NTSTATUS code that indicates success or failure for the request. NTSTATUS codes are specified in [MS-ERREF] section 2.3.

2.2.1.5.1 Device Create Response (DR_CREATE_RSP)

A message with this header describes a response to a Device Create Request (section 2.2.1.4.1).

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION header. The **CompletionId** field of this header MUST match a Device I/O Request (section 2.2.1.4) message that had the **MajorFunction** field set to IRP_MJ_CREATE.

FileId (4 bytes): A 32-bit unsigned integer that specifies a unique ID for the created file object. The ID MUST be reused after sending a Device Close Response (section 2.2.1.5.2).

Information (1 byte): An unsigned 8-bit integer. This field indicates the success of the Device Create Request (section 2.2.1.4.1). The value of the **Information** field depends on the value of **CreateDisposition** field in the Device Create Request (section 2.2.1.4.1). If the **IoStatus** field is set to 0x00000000, this field MAY be skipped, <7> in which case the server MUST assume that the **Information** field is set to 0x00. The possible values of the **Information** field are:

Value	Meaning
FILE_SUPERSEDED 0x00000000	A new file was created.
FILE_OPENED 0x00000001	An existing file was opened.
FILE_OVERWRITTEN 0x00000003	An existing file was overwritten.

The values of the **CreateDisposition** field in the Device Create Request (section 2.2.1.4.1) that determine the value of the **Information** field are associated as follows:

Information field value	CreateDisposition field value
FILE_SUPERSEDED	FILE_SUPERSEDE FILE_OPEN FILE_CREATE FILE_OVERWRITE
FILE_OPENED	FILE_OPEN_IF
FILE_OVERWRITTEN	FILE_OVERWRITE_IF

2.2.1.5.2 Device Close Response (DR_CLOSE_RSP)

This message is a reply to a Device Close Request (section 2.2.1.4.2).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoReply (16 bytes)																															
...																															
...																															
Padding																															

DeviceIoReply (16 bytes): A DR_DEVICE_IOCOMPLETION header. The **CompletionId** field of this header MUST match a Device I/O Request (section 2.2.1.4) message that had the **MajorFunction** field set to IRP_MJ_CLOSE.

Padding (4 bytes): An array of 4 bytes. Reserved. This field can be set to any value and MUST be ignored.

2.2.1.5.3 Device Read Response (DR_READ_RSP)

A message with this header describes a response to a Device Read Request (section 2.2.1.4.3).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoReply (16 bytes)																															
...																															
...																															
Length																															
ReadData (variable)																															
...																															

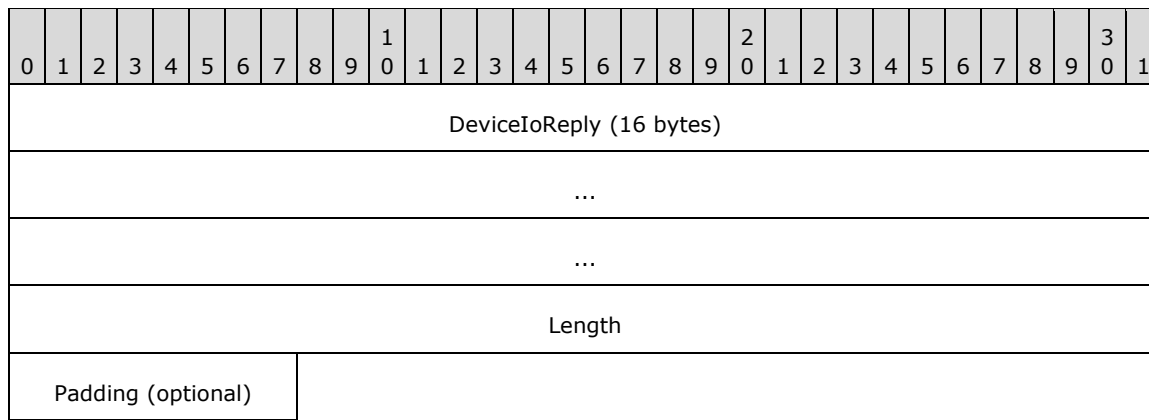

DeviceIoReply (16 bytes): A DR_DEVICE_IOCOMPLETION header. The **CompletionId** field of this header MUST match a Device I/O Request (section 2.2.1.4) message that had the **MajorFunction** field set to IRP_MJ_READ.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **ReadData** field.

ReadData (variable): A variable-length array of bytes that specifies the output data from the read request. The length of **ReadData** is specified by the **Length** field in this packet.

2.2.1.5.4 Device Write Response (DR_WRITE_RSP)

A message with this header describes a response to a Device Write Request (section 2.2.1.4.4).

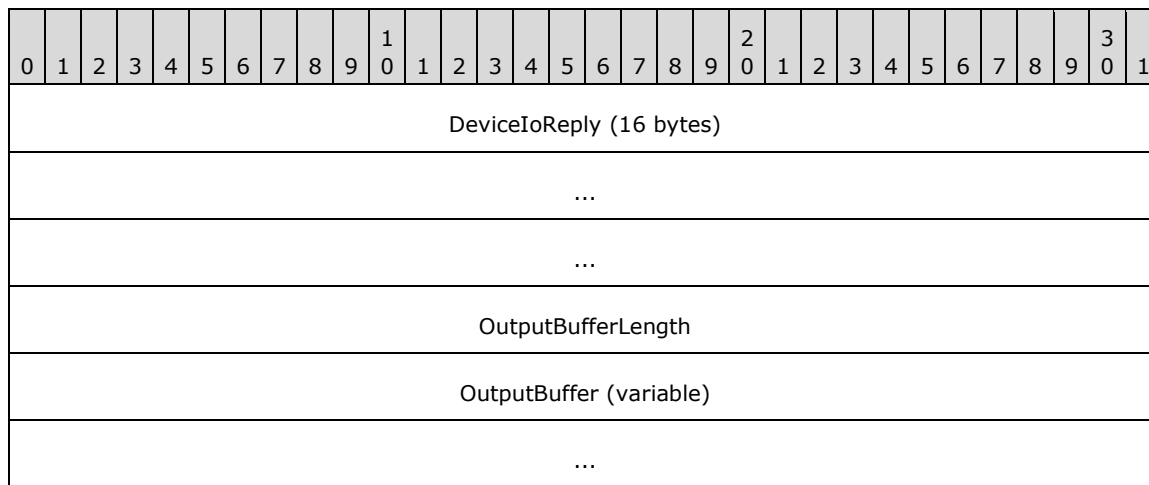

DeviceIoReply (16 bytes): A DR_DEVICE_IOCOMPLETION header. The **CompletionId** field of this header MUST match a Device I/O Request (section 2.2.1.4) message that had the **MajorFunction** field set to IRP_MJ_WRITE.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes written in response to the write request.

Padding (1 byte): An 8-bit unsigned integer intended to allow the client minor flexibility in determining the overall packet length. This field is unused and MUST be ignored.

2.2.1.5.5 Device Control Response (DR_CONTROL_RSP)

A message with this header describes a response to a Device Control Request (section 2.2.1.4.5).

DeviceIoReply (16 bytes): A DR_DEVICE_IOCOMPLETION header. The **CompletionId** field of this header MUST match a Device I/O Request (section 2.2.1.4) that had the **MajorFunction** field set to IRP_MJ_DEVICE_CONTROL.

OutputBufferLength (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **OutputBuffer** field.

OutputBuffer (variable): A variable-length array of bytes whose size is specified by the **OutputBufferLength** field.

2.2.1.6 RDP_LOCK_INFO

The RDP_LOCK_INFO packet specifies the region of the file to lock or unlock.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Length																															
...																															
Offset																															
...																															

Length (8 bytes): A 64-bit unsigned integer that specifies the length of the region. A value of zero is valid and MUST result in locking the zero length region.

Offset (8 bytes): A 64-bit unsigned integer that specifies the offset at which the region starts.

2.2.2 Initialization Messages

2.2.2.1 Server Device Announce Response (DR_CORE_DEVICE_ANNOUNCE_RSP)

The server responds to a Client Device List Announce Request with this message.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
DeviceId																															
ResultCode																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICE_REPLY.

DeviceId (4 bytes): A 32-bit unsigned integer. This ID MUST be the same as one of the IDs specified in the Client Device List Announce Request message. The server sends a separate Server Device Announce Response message for each announced device.

ResultCode (4 bytes): A 32-bit unsigned integer that specifies the NTSTATUS code that indicates the success or failure of device initialization. NTSTATUS codes are specified in [MS-ERREF] section 2.3.

2.2.2.2 Server Announce Request (DR_CORE_SERVER_ANNOUNCE_REQ)

The server initiates the protocol with this message.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															

VersionMajor	VersionMinor
ClientId	

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_SERVER_ANNOUNCE.

VersionMajor (2 bytes): A 16-bit unsigned integer that specifies the server major version number. This field MUST be set to 0x0001.

VersionMinor (2 bytes): A 16-bit unsigned integer that specifies the server minor version number. This field MUST be set to one of several values<8>.

ClientId (4 bytes): A 32-bit unsigned integer that specifies the unique ID generated by the server as specified in section 3.3.5.1.2.

2.2.2.3 Client Announce Reply (DR_CORE_CLIENT_ANNOUNCE_RSP)

The client replies to the Server Announce Request message.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
VersionMajor																VersionMinor															
ClientId																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_CLIENTID_CONFIRM.

VersionMajor (2 bytes): A 16-bit unsigned integer that specifies the major version number of the file system redirection protocol. This field MUST be set to 0x0001.

VersionMinor (2 bytes): A 16-bit unsigned integer that specifies the minor version number of the file system redirection protocol. This field MUST be set to one of the following values.

Value	Meaning
0x000D	Minor version 13
0x000C	Minor version 12
0x000A	Minor version 10
0x0005	Minor version 5
0x0002	Minor version 2

ClientId (4 bytes): A 32-bit unsigned integer that the client MUST set to either the **ClientId** field, which is supplied by the server in the Server Announce Request message, or a unique ID as specified in section 3.2.5.1.3.

2.2.2.4 Client Name Request (DR_CORE_CLIENT_NAME_REQ)

The client announces its machine name.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
UnicodeFlag																															
CodePage																															
ComputerNameLen																															
ComputerName (variable)																															
...																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_CLIENT_NAME.

UnicodeFlag (4 bytes): A 32-bit unsigned integer that indicates the format of the **ComputerName** field. Only the least significant bit of this field is valid (the most significant 31 bits MUST be ignored). The least significant bit MUST be set to one of the following values.

Value	Meaning
0x1	ComputerName is in Unicode characters.
0x0	ComputerName is in ASCII characters.

CodePage (4 bytes): A 32-bit unsigned integer that specifies the code page of the **ComputerName** field; it MUST be set to 0.

ComputerNameLen (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **ComputerName** field, including null terminator.

ComputerName (variable): A variable-length array of ASCII or Unicode characters, the format of which is determined by the **UnicodeFlag** field. This is a string that identifies the client computer name. The string MUST be null-terminated. The protocol imposes no limitations on the characters used in this field.

2.2.2.5 Server User Logged On (DR_CORE_USER_LOGGEDON)

The server announces that it has successfully logged on to the session.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_USER_LOGGEDON.

2.2.2.6 Server Client ID Confirm (DR_CORE_SERVER_CLIENTID_CONFIRM)

The server confirms the client ID sent by the client in the Client Announce Reply message.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
VersionMajor																VersionMinor															
ClientId																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_CLIENTID_CONFIRM.

VersionMajor (2 bytes): A 16-bit unsigned integer that specifies the major version number of the file system redirection protocol. This field MUST be set to 0x0001.

VersionMinor (2 bytes): A 16-bit unsigned integer that specifies the minor version number of the file system redirection protocol. This field MUST be set to one of the following values.

Value	Meaning
0x000D	Minor version 13
0x000C	Minor version 12
0x000A	Minor version 10
0x0005	Minor version 5
0x0002	Minor version 2

ClientId (4 bytes): A 32-bit unsigned integer that confirms the unique ID value of the **ClientId** field, which was sent by the client in the Client Announce Reply message.

2.2.2.7 Server Core Capability Request (DR_CORE_CAPABILITY_REQ)

The server announces its capabilities and requests the same from the client.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
numCapabilities																Padding															
CapabilityMessage (variable)																															
...																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_SERVER_CAPABILITY.

numCapabilities (2 bytes): A 16-bit integer that specifies the number of items in the **CapabilityMessage** array.

Padding (2 bytes): A 16-bit unsigned integer of padding. This field is unused and **MUST** be ignored.

CapabilityMessage (variable): An array of CAPABILITY_SET structures (section 2.2.1.2.1). The number of capabilities is specified by the **numCapabilities** field.

2.2.2.7.1 General Capability Set (GENERAL_CAPS_SET)

This packet is embedded into Server Core Capability Request and Client Core Capability Response messages. It describes non-device-specific capabilities.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
...																															
osType																															
osVersion																															
protocolMajorVersion																protocolMinorVersion															
ioCode1																															
ioCode2																															
extendedPDU																															
extraFlags1																															
extraFlags2																															
SpecialTypeDeviceCap																															

Header (8 bytes): A CAPABILITY_HEADER header. The **CapabilityType** field of this header **MUST** be set to CAP_GENERAL_TYPE. The **Version** field of this header **MUST** have one of the following values.

Value	Meaning
GENERAL_CAPABILITY_VERSION_01 0x00000001	Version 1. The SpecialTypeDeviceCap field of GENERAL_CAPS_SET is not present.
GENERAL_CAPABILITY_VERSION_02 0x00000002	Version 2. The SpecialTypeDeviceCap field of GENERAL_CAPS_SET is present.

osType (4 bytes): A 32-bit unsigned integer that is the identifier for the operating system that the capabilities are describing. The value of this field **MUST** be ignored.

osVersion (4 bytes): A 32-bit unsigned integer. This field is unused and **SHOULD** be ignored.

protocolMajorVersion (2 bytes): A 16-bit unsigned integer. This field MUST be set to 1.

protocolMinorVersion (2 bytes): A 16-bit unsigned integer. This field MUST be set to one of the values described by the **VersionMinor** field of the Server Client ID Confirm (section 2.2.2.6) packet.

ioCode1 (4 bytes): A 32-bit unsigned integer that identifies a bitmask of the supported I/O requests for the given device. If the bit is set, the I/O request is allowed. The requests are identified by the **MajorFunction** field in the Device I/O Request (section 2.2.1.4) header. This field MUST be set to a valid combination of the following values.

Value	Meaning
RDPDR_IRP_MJ_CREATE 0x00000001	Unused, always set.
RDPDR_IRP_MJ_CLEANUP 0x00000002	Unused, always set.
RDPDR_IRP_MJ_CLOSE 0x00000004	Unused, always set.
RDPDR_IRP_MJ_READ 0x00000008	Unused, always set.
RDPDR_IRP_MJ_WRITE 0x00000010	Unused, always set.
RDPDR_IRP_MJ_FLUSH_BUFFERS 0x00000020	Unused, always set.
RDPDR_IRP_MJ_SHUTDOWN 0x00000040	Unused, always set.
RDPDR_IRP_MJ_DEVICE_CONTROL 0x00000080	Unused, always set.
RDPDR_IRP_MJ_QUERY_VOLUME_INFORMATION 0x00000100	Unused, always set.
RDPDR_IRP_MJ_SET_VOLUME_INFORMATION 0x00000200	Unused, always set.
RDPDR_IRP_MJ_QUERY_INFORMATION 0x00000400	Unused, always set.
RDPDR_IRP_MJ_SET_INFORMATION 0x00000800	Unused, always set.
RDPDR_IRP_MJ_DIRECTORY_CONTROL 0x00001000	Unused, always set.
RDPDR_IRP_MJ_LOCK_CONTROL 0x00002000	Unused, always set.
RDPDR_IRP_MJ_QUERY_SECURITY 0x00004000	Enable Query Security requests (IRP_MJ_QUERY_SECURITY).
RDPDR_IRP_MJ_SET_SECURITY	Enable Set Security requests (IRP_MJ_SET_SECURITY).

Value	Meaning
0x00008000	

ioCode2 (4 bytes): A 32-bit unsigned integer that is currently reserved for future use, and MUST be set to 0.

extendedPDU (4 bytes): A 32-bit unsigned integer that specifies extended PDU flags. This field MUST be set as a bitmask of the following values.

Value	Meaning
RDPDR_DEVICE_REMOVE_PDUS 0x00000001	Allow the client to send Client Drive Device List Remove packets.
RDPDR_CLIENT_DISPLAY_NAME_PDU 0x00000002	Unused, always set.
RDPDR_USER_LOGGEDON_PDU 0x00000004	Allow the server to send a Server User Logged On packet.

extraFlags1 (4 bytes): A 32-bit unsigned integer that specifies extended flags. The **extraFlags1** field MUST be set as a bitmask of the following value.

Value	Meaning
ENABLE_ASYNCIO 0x00000001	Optionally present only in the Client Core Capability Response. Allows the server to send multiple simultaneous read or write requests on the same file from a redirected file system.<9>

extraFlags2 (4 bytes): A 32-bit unsigned integer that is currently reserved for future use, and MUST be set to 0.

SpecialTypeDeviceCap (4 bytes): A 32-bit unsigned integer that specifies the number of special devices to be redirected before the user is logged on. Special devices are those that are safe and/or required to be redirected before a user logs on (such as smart cards and serial ports).

2.2.2.7.2 Printer Capability Set (PRINTER_CAPS_SET)

This packet is embedded into Server Core Capability Request and Client Core Capability Response messages. It indicates that printer devices are supported.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
...																															

Header (8 bytes): A CAPABILITY_HEADER header. The **CapabilityType** field of this header MUST be set to CAP_PRINTER_TYPE, and the **Version** field MUST be set to 0x00000001.

2.2.2.7.3 Port Capability Set (PORT_CAPS_SET)

This packet is embedded into Server Core Capability Request and Client Core Capability Response messages. It indicates that parallel and serial port devices are supported.

Header (8 bytes): A CAPABILITY_HEADER header. The **CapabilityType** field of this header MUST be set to CAP_PORT_TYPE, and the **Version** field MUST be set to 0x00000001.

2.2.2.7.4 Drive Capability Set (DRIVE_CAPS_SET)

This packet is embedded into Server Core Capability Request and Client Core Capability Response messages. It indicates that file system devices are supported.

Header (8 bytes): A CAPABILITY_HEADER header. The **CapabilityType** field of this header MUST be set to CAP_DRIVE_TYPE, and the **Version** field MUST be set to DRIVE_CAPABILITY_VERSION_02.

2.2.2.7.5 Smart Card Capability Set (SMARTCARD_CAPS_SET)

This packet is embedded into Server Core Capability Request and Client Core Capability Response messages. It indicates that smart card devices are supported. <10>

Header (8 bytes): A CAPABILITY_HEADER header. The **CapabilityType** field of this header MUST be set to CAP_SMARTCARD_TYPE, and the **Version** field MUST be set to 0x00000001.

2.2.2.8 Client Core Capability Response (DR_CORE_CAPABILITY_RSP)

This packet is identical to Server Core Capability Request (section 2.2.2.7) with the exception that the **PacketId** field in RDPDR_HEADER (section 2.2.1.1) MUST be set to PAKID_CORE_CLIENT_CAPABILITY.

2.2.2.9 Client Device List Announce Request (DR_CORE_DEVICELIST_ANNOUNCE_REQ)

The client announces the list of devices to redirect on the server.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
DeviceCount																															
DeviceList (variable)																															
...																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICELIST_ANNOUNCE.

DeviceCount (4 bytes): A 32-bit unsigned integer that specifies the number of items in the **DeviceList** array.

DeviceList (variable): A variable-length array of DEVICE_ANNOUNCE (section 2.2.1.3) headers. This field specifies a list of devices that are being announced. The number of entries is specified by the **DeviceCount** field. There is no alignment padding between individual DEVICE_ANNOUNCE structures. They are ordered sequentially within this packet.

2.2.3 Drive Redirection Messages

2.2.3.1 Client Device List Announce (DR_DEVICELIST_ANNOUNCE)

The client announces a list of new file system devices to redirect on the server.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
Header																															
DeviceCount																															
DeviceAnnounce (variable)																															
...																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICELIST_ANNOUNCE.

DeviceCount (4 bytes): A 32-bit unsigned integer that specifies the number of entries in the **DeviceAnnounce** field.

DeviceAnnounce (variable): A variable-length array of DEVICE_ANNOUNCE (section 2.2.1.3) headers. The number of entries is specified by the **DeviceCount** field. Each entry is a DEVICE_ANNOUNCE header in which the **DeviceType** field MUST be set to RDPDR_DTYP_FILESYSTEM. <11> The drive name MUST be specified in the **PreferredDosName** field; however, if the drive name is larger than the allocated size of the **PreferredDosName** field, then the drive name MUST be truncated to fit. If the client supports DRIVE_CAPABILITY_VERSION_02 in the Drive Capability Set, then the full name MUST also be

specified in the **DeviceData** field, as a null-terminated Unicode string. If the **DeviceDataLength** field is nonzero, the content of the **PreferredDosName** field is ignored. There is no alignment padding between individual DEVICE_ANNOUNCE headers. They are ordered sequentially within this packet.

Note The **PreferredDosName** field is used for all device types and is not limited to drives.

2.2.3.2 Client Drive Device List Remove (DR_DEVICELIST_REMOVE)

The client removes a list of already-announced devices from the server.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
Header																															
DeviceCount																															
DeviceIds (variable)																															
...																															

Header (4 bytes): An RDPDR_HEADER header. The **Component** field MUST be set to RDPDR_CTYP_CORE, and the **PacketId** field MUST be set to PAKID_CORE_DEVICELIST_REMOVE.

DeviceCount (4 bytes): A 32-bit unsigned integer that specifies the number of entries in the **DeviceIds** field.

DeviceIds (variable): A variable-length array of 32-bit unsigned integers that specifies device IDs. The IDs specified in this array match the IDs specified in the Client Device List Announce (section 2.2.3.1) packet.

Note The client can send the DR_DEVICELIST_REMOVE message for devices that are removed after a session is connected. The server can accept the DR_DEVICE_REMOVE message for any removed device, including file system and port devices. The server can also accept reused DeviceIds of devices that have been removed, providing the implementation uses the DR_DEVICE_REMOVE message to do so.

2.2.3.3 Server Drive I/O Request (DR_DRIVE_CORE_DEVICE_IOREQUEST)

The server issues a device I/O request on a redirected file system device. Each request begins with a DR_DEVICE_IOREQUEST (section 2.2.1.4) header, in which the **DeviceId** field MUST be set to a device that has been announced as a file system device.

2.2.3.3.1 Server Create Drive Request (DR_DRIVE_CREATE_REQ)

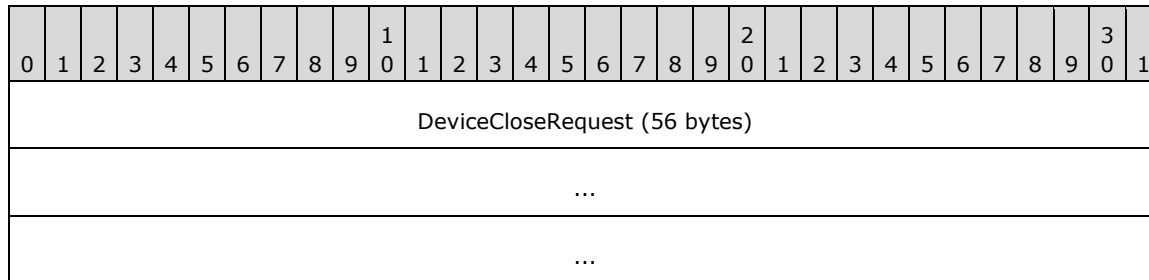

The server opens or creates a file on a redirected file system device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceCreateRequest (variable)																															
...																															

DeviceCreateRequest (variable): A DR_CREATE_REQ header. The **PathLength** and **Path** fields contain the file name of the file to be created. The file name does not contain a drive letter, which means that the drive is specified by the **DeviceId** field of the request. The **DeviceId** is associated with a drive letter when the device is announced in the DR_DEVICELIST_ANNOUNCE (section 2.2.3.1) message. The drive letter is contained in the **PreferredDosName** field.

2.2.3.3.2 Server Close Drive Request (DR_DRIVE_CLOSE_REQ)

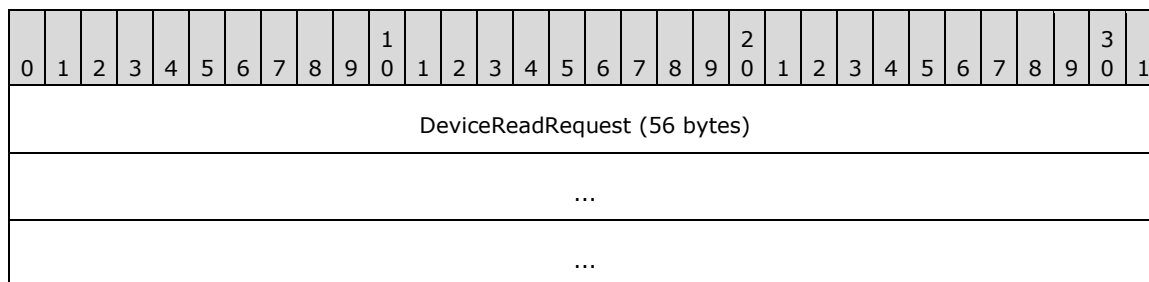

The server closes a file on a redirected file system device.

DeviceCloseRequest (56 bytes): A DR_CLOSE_REQ header. This request closes a file opened by a Server Create Drive Request (section 2.2.3.3.1).

2.2.3.3.3 Server Drive Read Request (DR_DRIVE_READ_REQ)

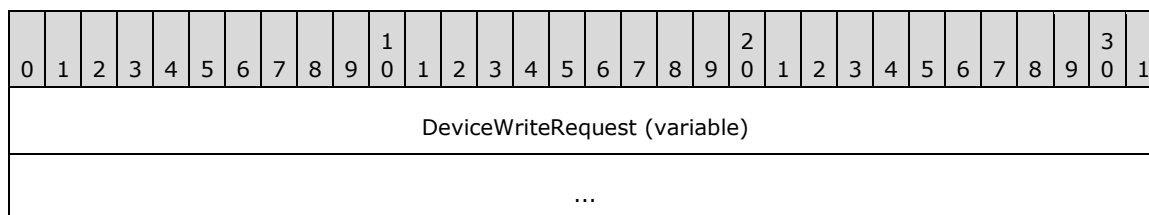

The server reads from a file on a redirected file system device.

DeviceReadRequest (56 bytes): A DR_READ_REQ header. The **Length** field contains the number of bytes to be read from the file. The **Offset** field specifies the offset within the file at which the read operation starts.

2.2.3.3.4 Server Drive Write Request (DR_DRIVE_WRITE_REQ)

The server writes to a file on a redirected file system device.

DeviceWriteRequest (variable): A DR_WRITE_REQ header. The **Length** field contains the number of bytes to be written to the file. The **Offset** field specifies the offset within the file at which the write operation starts.

2.2.3.3.5 Server Drive Control Request (DR_DRIVE_CONTROL_REQ)

The server issues a device control request on a redirected file system device.

DeviceControlRequest (variable): A DR_CONTROL_REQ header. The packet has a structure as defined in Device Control Request (section 2.2.1.4.5). The possible values for the **IoControlCode** field are a subset of the file system control (FSCTL) commands specified in [MS-FSCC] section 2.3. The content of the **InputBuffer** field is defined in the request type messages that are specified in the same section of [MS-FSCC].

The following list indicates the FSCTL commands supported by this protocol.

- FSCTL_CREATE_OR_GET_OBJECT_ID
- FSCTL_DELETE_OBJECT_ID
- FSCTL_DELETE_REPARSE_POINT
- FSCTL_FILESYSTEM_GET_STATISTICS
- FSCTL_FIND_FILES_BY_SID
- FSCTL_GET_COMPRESSION
- FSCTL_GET_NTFS_VOLUME_DATA
- FSCTL_GET_OBJECT_ID
- FSCTL_GET_REPARSE_POINT
- FSCTL_GET_RETRIEVAL_POINTERS
- FSCTL_IS_PATHNAME_VALID
- FSCTL_LMR_GET_LINK_TRACKING_INFORMATION
- FSCTL_LMR_SET_LINK_TRACKING_INFORMATION
- FSCTL_PIPE_TRANSCEIVE
- FSCTL_PIPE_WAIT
- FSCTL_QUERY_ALLOCATED_RANGES
- FSCTL_READ_FILE_USN_DATA
- FSCTL_RECALL_FILE
- FSCTL_SET_COMPRESSION
- FSCTL_SET_ENCRYPTION
- FSCTL_SET_OBJECT_ID

- FSCTL_SET_OBJECT_ID_EXTENDED
- FSCTL_SET_REPARSE_POINT
- FSCTL_SET_SHORT_NAME_BEHAVIOR
- FSCTL_SET_SPARSE
- FSCTL_SET_ZERO_DATA
- FSCTL_SET_ZERO_ON_DEALLOCATION
- FSCTL_SIS_COPYFILE
- FSCTL_WRITE_USN_CLOSE_RECORD

2.2.3.3.6 Server Drive Query Volume Information Request (DR_DRIVE_QUERY_VOLUME_INFORMATION_REQ)

The server issues a query volume information request on a redirected file system device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
FsInformationClass																															
Length																															
Padding (24 bytes)																															
...																															
...																															
QueryVolumeBuffer (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_QUERY_VOLUME_INFORMATION.

FsInformationClass (4 bytes): A 32-bit unsigned integer. The possible values for this field are specified in [MS-FSCC] section 2.5. This field MUST contain one of the following values.

Value	Meaning
FileFsVolumeInformation 0x00000001	Used to query information for a volume on which a file system is mounted. The Reserved field of the FileFsVolumeInformation structure ([MS-FSCC] section 2.5.9) MUST NOT be present.

Value	Meaning
FileFsSizeInformation 0x00000003	Used to query sector size information for a file system volume.
FileFsAttributeInformation 0x00000005	Used to query attribute information for a file system.
FileFsFullSizeInformation 0x00000007	Used to query sector size information for a file system volume.
FileFsDeviceInformation 0x00000004	Used to query device information for a file system volume.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **QueryVolumeBuffer** field.

Padding (24 bytes): An array of 24 bytes. This field is unused and MUST be ignored.

QueryVolumeBuffer (variable): A variable-length array of bytes. The size of the array is specified by the **Length** field. The content of this field is based on the value of the **FsInformationClass** field, which determines the different structures that MUST be contained in the **QueryVolumeBuffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.5. The "File system information class" table defines all the possible values for the **FsInformationClass** field.

2.2.3.3.7 Server Drive Set Volume Information Request (DR_DRIVE_SET_VOLUME_INFORMATION_REQ)

The server issues a set volume information request on a redirected file system device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)

FsInformationClass																															
Length																															
Padding (24 bytes)																															
...																															
...																															
SetVolumeBuffer (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_SET_VOLUME_INFORMATION.

FsInformationClass (4 bytes): A 32-bit unsigned integer. The possible values for this field are defined in [MS-FSCC] section 2.5. This field MUST contain the following value.

Value	Meaning
FileFsLabelInformation 0x00000002	Used to set the label for a file system volume.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **SetVolumeBuffer** field.

Padding (24 bytes): An array of 24 bytes. This field is unused and MUST be ignored.

SetVolumeBuffer (variable): A variable-length array of bytes. The size of the array is specified by the **Length** field. The content of this field is based on the value of the **FsInformationClass** field, which determines the different structures that MUST be contained in the **SetVolumeBuffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.5. The "File system information class" table defines all the possible values for the **FsInformationClass** field.

2.2.3.3.8 Server Drive Query Information Request (DR_DRIVE_QUERY_INFORMATION_REQ)

The server issues a query information request on a redirected file system device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)

FsInformationClass																															
Length																															
Padding (24 bytes)																															
...																															
...																															
QueryBuffer (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_QUERY_INFORMATION.

FsInformationClass (4 bytes): A 32-bit unsigned integer. The possible values for this field are defined in [MS-FSCC] section 2.4. This field **MUST** contain one of the following values.

Value	Meaning
FileBasicInformation 0x00000004	This information class is used to query a file for the times of creation, last access, last write, and change, in addition to file attribute information. The Reserved field of the FileBasicInformation structure ([MS-FSCC] section 2.4.7) MUST NOT be present.
FileStandardInformation 0x00000005	This information class is used to query for file information such as allocation size, end-of-file position, and number of links. The Reserved field of the FileStandardInformation structure ([MS-FSCC] section 2.4.38) MUST NOT be present.
FileAttributeTagInformation 0x00000023	This information class is used to query for file attribute and reparse tag information.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **QueryBuffer** field.

Padding (24 bytes): An array of 24 bytes. This field is unused and **MUST** be ignored.

QueryBuffer (variable): A variable-length array of bytes. The size of the array is specified by the **Length** field. The content of this field is based on the value of the **FsInformationClass** field, which determines the different structures that **MUST** be contained in the **QueryBuffer** field. For a complete list of these structures, see [MS-FSCC] section 2.4. The "File information class" table defines all the possible values for the **FsInformationClass** field.

2.2.3.3.9 Server Drive Set Information Request (DR_DRIVE_SET_INFORMATION_REQ)

The server issues a set information request on a redirected file system device.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoRequest (24 bytes)																															
...																															
...																															
FsInformationClass																															
Length																															
Padding (24 bytes)																															
...																															
...																															
SetBuffer (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_SET_INFORMATION.

FsInformationClass (4 bytes): A 32-bit unsigned integer. The possible values for this field are defined in [MS-FSCC] section 2.4. The **FsInformationClass** field is a 32-bit value, even though the values described in [MS-FSCC] are single byte only. For the purposes of conversion, the highest 24 bits are always set to zero. This field MUST contain one of the following values.

Value	Meaning
FileBasicInformation 0x00000004	This information class is used to set file information such as the times of creation, last access, last write, and change, in addition to file attributes.
FileEndOfFileInformation 0x00000014	This information class is used to set end-of-file information for a file.
FileDispositionInformation 0x0000000D	This information class is used to mark a file for deletion.
FileRenameInformation 0x0000000A	This information class is used to rename a file.
FileAllocationInformation 0x00000013	This information class is used to set the allocation size for a file.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **SetBuffer** field.

Padding (24 bytes): An array of 24 bytes. This field is unused and MUST be ignored.

SetBuffer (variable): A variable-length array of bytes. The size of the array is specified by the **Length** field. The content of this field is based on the value of the **FsInformationClass** field, which determines the different structures that MUST be contained in the **SetBuffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.4. The "File information class" table defines all the possible values for the **FsInformationClass** field with the exception of the following values.

Value of FsInformationClass	Meaning of content of SetBuffer field
FileDispositionInformation	The buffer is empty. The Length field is set to zero. It is implied that the DeletePending field of the FILE_DISPOSITION_INFORMATION structure, as described in [MS-FSCC], is set to 1.
FileRenameInformation	See RDP_FILE_RENAME_INFORMATION.

2.2.3.3.9.1 RDP_FILE_RENAME_INFORMATION

RDP_FILE_RENAME_INFORMATION is a structure representing FileRenameInformation as a possible value of the FsInformationClass field. All fields have the same meaning as in FILE_RENAME_INFORMATION in [MS-FSCC] section 2.4.34. The differences are only in the layout of the fields.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
ReplaceIfExists										RootDirectory										FileNameLength											
...										...										FileName (variable)											
...																															

ReplaceIfExists (1 byte): See [MS-FSCC] section 2.4.34 for a description of this field.

RootDirectory (1 byte): See [MS-FSCC] section 2.4.34 for a description of this field. For network operations, the value of the RootDirectory field in this structure MUST always be zero.

FileNameLength (4 bytes): See [MS-FSCC] section 2.4.34 for a description of this field.

FileName (variable): See [MS-FSCC] section 2.4.34 for a description of this field.

2.2.3.3.10 Server Drive Query Directory Request (DR_DRIVE_QUERY_DIRECTORY_REQ)

The server issues a query directory request on a redirected file system device. This request is used to obtain a directory enumeration.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
DeviceIoRequest (24 bytes)																															
...																															
...																															
FsInformationClass																															
InitialQuery										PathLength																					
...										Padding (23 bytes)																					
...																															
...																															
Path (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_DIRECTORY_CONTROL, and the **MinorFunction** field MUST be set to IRP_MN_QUERY_DIRECTORY.

FsInformationClass (4 bytes): A 32-bit unsigned integer. The possible values are specified in [MS-FSCC] section 2.4. This field MUST contain one of the following values.

Value	Meaning
FileDirectoryInformation 0x00000001	Basic information about a file or directory. Basic information is defined as the file's name, time stamp, and size, or its attributes.
FileFullDirectoryInformation 0x00000002	Full information about a file or directory. Full information is defined as all the basic information, plus extended attribute size.
FileBothDirectoryInformation 0x00000003	Basic information plus extended attribute size and short name about a file or directory. The Reserved field of the FileBothDirectoryInformation structure ([MS-FSCC] section 2.4.8) MUST NOT be present.
FileNamesInformation 0x0000000C	Detailed information on the names of files in a directory.

InitialQuery (1 byte): An 8-bit unsigned integer. If the value is zero, the **Path** field is not included regardless of the PathLength value. If the value is set to zero, the request is for the next file in the directory specified in a previous Server Drive Query Directory Request. If such a file does not exist, the client MUST complete this request with STATUS_NO_MORE_FILES in the **IoStatus** field of the Client Drive I/O Response packet.

PathLength (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Path** field, including the null-terminator.

Padding (23 bytes): An array of 23 bytes. This field is unused and MUST be ignored.

Path (variable): A variable-length array of Unicode characters that specifies the directory on which this operation will be performed. The **Path** field MUST be null-terminated.

2.2.3.3.11 Server Drive NotifyChange Directory Request (DR_DRIVE_NOTIFY_CHANGE_DIRECTORY_REQ)

The server issues a notify change directory request on a redirected file system device to request directory change notification.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
DeviceIoRequest (24 bytes)																															
...																															
...																															
WatchTree																CompletionFilter															
...																Padding (27 bytes)															
...																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_DIRECTORY_CONTROL, and the **MinorFunction** field MUST be set to IRP_MN_NOTIFY_CHANGE_DIRECTORY.

WatchTree (1 byte): An 8-bit unsigned integer. If nonzero, a change anywhere within the tree MUST trigger the notification response; otherwise, only a change in the root directory will do so.

CompletionFilter (4 bytes): A 32-bit unsigned integer. This field has the same meaning as the **CompletionFilter** field in the SMB2 CHANGE_NOTIFY Request message specified in [MS-SMB2] section 2.2.35.

Padding (27 bytes): An array of 27 bytes. This field is unused and MUST be ignored.

2.2.3.3.12 Server Drive Lock Control Request (DR_DRIVE_LOCK_REQ)

The server issues a request to lock or unlock portions of a file.

0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
DeviceIoRequest (24 bytes)																															
...																															
...																															
Operation																															
F	Padding																														
NumLocks																															
Padding2 (20 bytes)																															
...																															
...																															
Locks (variable)																															
...																															

DeviceIoRequest (24 bytes): A DR_DEVICE_IOREQUEST (section 2.2.1.4) header. The **MajorFunction** field in the DR_DEVICE_IOREQUEST header MUST be set to IRP_MJ_LOCK_CONTROL.

Operation (4 bytes): A 32-bit unsigned integer that specifies the type of the locking operation. It MUST have one of the following values:

Value	Meaning
RDP_LOWIO_OP_SHAREDLOCK 0x00000002	The server is requesting a shared lock.
RDP_LOWIO_OP_EXCLUSIVELOCK 0x00000003	The server is requesting an exclusive lock.
RDP_LOWIO_OP_UNLOCK	The server is requesting to unlock a portion of the file.

Value	Meaning
0x00000004	
RDP_LOWIO_OP_UNLOCK_MULTIPLE 0x00000005	The server is requesting to unlock multiple portions of the file.

If this field has any other value, the request MUST be failed immediately.

F (1 bit): If this bit is set, the client MUST wait for the locking operation to complete. If this bit is not set and the region cannot be locked, the request SHOULD fail.

Padding (31 bits): 31 bits of padding. This field is unused and MUST be ignored.

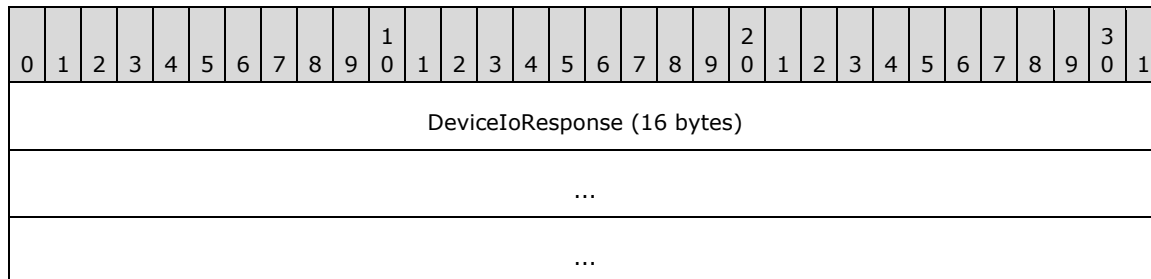

NumLocks (4 bytes): A 32-bit unsigned integer that specifies the number of RDP_LOCK_INFO structures in the **Locks** array.

Padding2 (20 bytes): An array of 20 bytes. Reserved. This field can be set to any value and MUST be ignored.

Locks (variable): A variable-length array of RDP_LOCK_INFO structures. This field specifies one or more regions of the file to lock or unlock.

2.2.3.4 Client Drive I/O Response (DR_DRIVE_CORE_DEVICE_IOCOMPLETION)

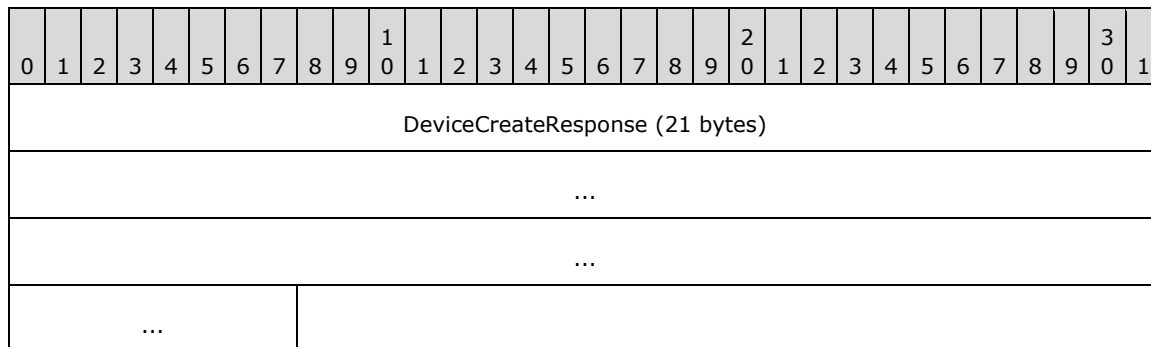

This type of message is sent by the client as a response to the Server Drive I/O Request (section 2.2.3.3).

DeviceIoResponse (16 bytes): A DR_DEVICE_IOCOMPLETION header. This common response header indicating the I/O response is the same as the Device I/O Response (section 2.2.1.5).

2.2.3.4.1 Client Drive Create Response (DR_DRIVE_CREATE_RSP)

This message is sent by the client as a response to the Server Create Drive Request (section 2.2.3.3.1).

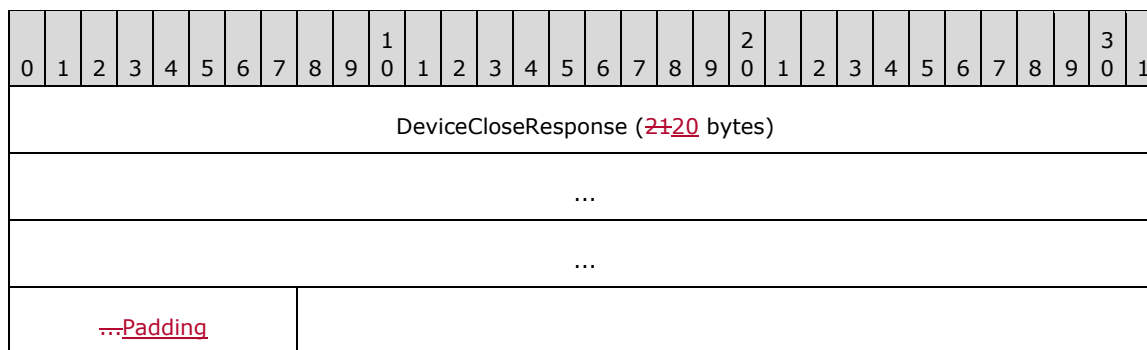

DeviceCreateResponse (21 bytes): A DR_CREATE_RSP header. This response indicates the success or failure of the opening of the specified file. It matches the common Device Create Response (section 2.2.1.5.1). If the create operation is successful, the content of the **Information** field in the Device Create Response message **MUST** have one of the following values, depending on the value of the **CreateDisposition** field of the Server Create Drive Request (section 2.2.3.3.1) message. In case of failure, the **Information** field can be set to any value, and **MUST** be ignored.

Value	Meaning
FILE_OPENED 0x01	The CreateDisposition field was set to FILE_OPEN_IF.
FILE_OVERWRITTEN 0x03	The CreateDisposition field was set to FILE_OVERWRITE_IF.
FILE_SUPERSEDED 0x00	The CreateDisposition field was set to any other value.

2.2.3.4.2 Client Drive Close Response (DR_DRIVE_CLOSE_RSP)

This message is sent by the client as a response to the Server Close Drive Request (section 2.2.3.3.2).

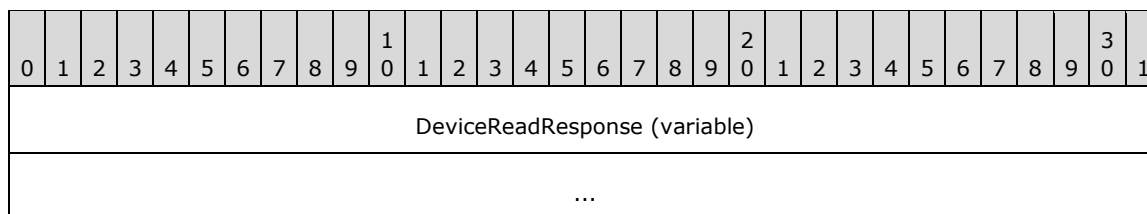

DeviceCloseResponse (~~21~~20 bytes): A DR_CLOSE_RSP (section 2.2.1.5.2) packet. The DR_CLOSE_RSP packet is sent in response to DR_DRIVE_CLOSE_REQ; it is the same as the common Device Close Response (section 2.2.1.5.2).

Padding (1 byte): An 8-bit unsigned integer that is intended to allow the client minor flexibility in determining the overall packet length. This field is unused and **MUST** be ignored.

2.2.3.4.3 Client Drive Read Response (DR_DRIVE_READ_RSP)

This message is sent by the client as a response to the Server Drive Read Request (section 2.2.3.3.3).

DeviceReadResponse (variable): Returns the result of the DR_DRIVE_READ_REQ; it is the same as the common Device Read Response (section 2.2.1.5.3). If successful (that is, if the **IoStatus** field is equal to STATUS_SUCCESS), then the amount of data read is any number between one and the number of bytes specified by the **Length** field in the Server Drive Read Request (section 2.2.3.3.3) message.

2.2.3.4.4 Client Drive Write Response (DR_DRIVE_WRITE_RSP)

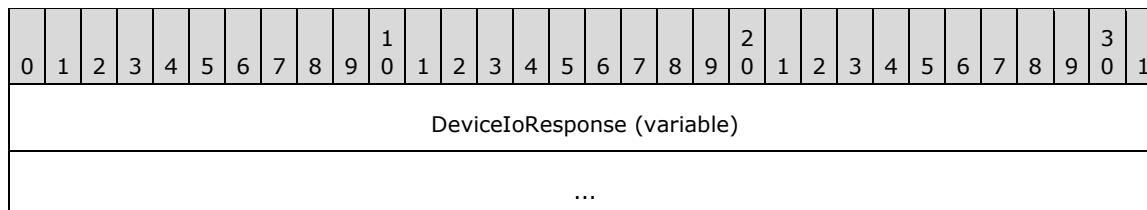

This message is sent by the client as a response to the Server Drive Write Request (section 2.2.3.3.4).

DeviceWriteResponse (variable): Returns the result of DR_DRIVE_WRITE_REQ; it is the same as the common Device Write Response (section 2.2.1.5.4). If successful (that is, if the **IoStatus** field is equal to STATUS_SUCCESS), then the number of bytes written is specified by the **Length** field of the Server Drive Write Request (section 2.2.3.3.4) message.

2.2.3.4.5 Client Drive Control Response (DR_DRIVE_CONTROL_RSP)

This message is sent by the client as a response to the Server Drive Control Request (section 2.2.3.3.5).

DeviceIoResponse (variable): Returns the result of DR_DRIVE_CONROL_REQ; it is the same as the common Device Control Response (section 2.2.1.5.5). The content of the **OutputBuffer** field is described in [MS-FSCC] section 2.3 as a reply type message.

2.2.3.4.6 Client Drive Query Volume Information Response (DR_DRIVE_QUERY_VOLUME_INFORMATION_RSP)

This message is sent by the client as a response to the Server Drive Query Volume Information Request (section 2.2.3.3.6).

Length	
Buffer (variable)	
...	
Padding (optional)	

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_QUERY_VOLUME_INFORMATION.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Buffer** field.

Buffer (variable): A variable-length array of bytes whose size is specified by the **Length** field. The content of this field is based on the value of the **FsInformationClass** field in the Server Drive Query Volume Information Request message, which determines the different structures that MUST be contained in the **Buffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.5. The "File system information class" table defines all the possible values for the **FsInformationClass** field.

Padding (1 byte): An optional, 8-bit unsigned integer that is intended to allow the client minor flexibility in determining the overall packet length. This field is unused and MUST be ignored.

2.2.3.4.7 Client Drive Set Volume Information Response (DR_DRIVE_SET_VOLUME_INFORMATION_RSP)

This message is sent by the client as a response to the Server Drive Set Volume Information Request (section 2.2.3.3.7).

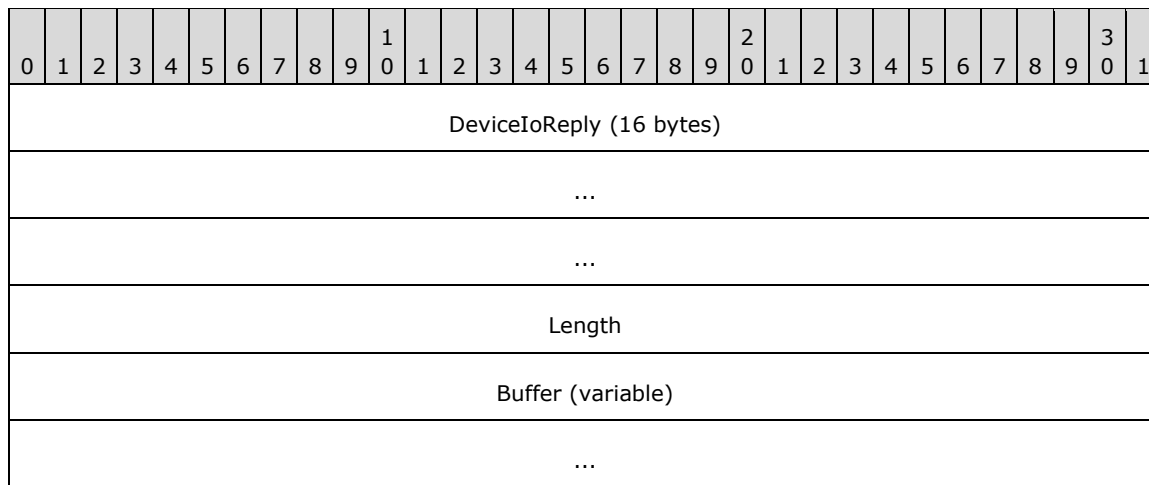

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoReply (16 bytes)																															
...																															
...																															
Length																															

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_SET_VOLUME_INFORMATION.

Length (4 bytes): A 32-bit unsigned integer. It MUST match the **Length** field in the Server Drive Set Volume Information Request.

2.2.3.4.8 Client Drive Query Information Response (DR_DRIVE_QUERY_INFORMATION_RSP)

This message is sent by the client as a response to the Server Drive Query Information Request (section 2.2.3.3.8).

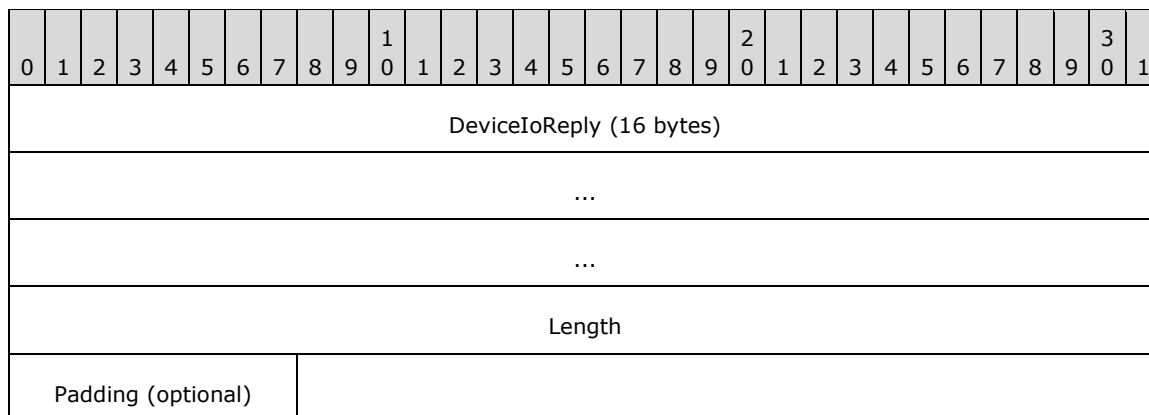

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_QUERY_INFORMATION.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Buffer** field.

Buffer (variable): A variable-length array of bytes, in which the number of bytes is specified in the **Length** field. The content of this field is based on the value of the **FsInformationClass** field in the Server Drive Query Information Request message, which determines the different structures that MUST be contained in the **Buffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.4. The "File information class" table defines all the possible values for the **FsInformationClass** field.

2.2.3.4.9 Client Drive Set Information Response (DR_DRIVE_SET_INFORMATION_RSP)

This message is sent by the client as a response to the Server Drive Set Information Request (section 2.2.3.3.9).

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_SET_INFORMATION.

Length (4 bytes): A 32-bit unsigned integer. This field MUST be equal to the **Length** field in the Server Drive Set Information Request (section 2.2.3.3.9).

Padding (1 byte): An optional, 8-bit unsigned integer that is intended to allow the client minor flexibility in determining the overall packet length. This field is unused and MUST be ignored.

2.2.3.4.10 Client Drive Query Directory Response (DR_DRIVE_QUERY_DIRECTORY_RSP)

This message is sent by the client as a response to the Server Drive Query Directory Request (section 2.2.3.3.10).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoReply (16 bytes)																															
...																															
...																															
Length																															
Buffer (variable)																															
...																															
Padding (optional)																															

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_DIRECTORY_CONTROL and the **MinorFunction** field set to IRP_MN_QUERY_DIRECTORY.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Buffer** field.

Buffer (variable): A variable-length array of bytes, in which the number of bytes is specified in the **Length** field. The content of this field is based on the value of the **FsInformationClass** field in the Server Drive Query Directory Request message, which determines the different structures that MUST be contained in the **Buffer** field. For a complete list of these structures, refer to [MS-FSCC] section 2.4. The "File information class" table defines all the possible values for the **FsInformationClass** field.

Padding (1 byte): An optional, 8-bit unsigned integer intended to allow the client minor flexibility in determining the overall packet length. This field is unused and MUST be ignored.

2.2.3.4.11 Client Drive NotifyChange Directory Response (DR_DRIVE_NOTIFY_CHANGE_DIRECTORY_RSP)

This message is sent by the client as a response to the Server Drive NotifyChange Directory Request (section 2.2.3.3.11).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

...																															

...
Length
Buffer (variable)
...
Padding (optional)

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_DIRECTORY_CONTROL and the **MinorFunction** field set to IRP_MN_NOTIFY_CHANGE_DIRECTORY.

Length (4 bytes): A 32-bit unsigned integer that specifies the number of bytes in the **Buffer** field.

Buffer (variable): A variable-length array of bytes, in which the number of bytes is specified in the **Length** field. This field has the same meaning as the **Buffer** field in the SMB2 CHANGE_NOTIFY Response message specified in [MS-SMB2] section 2.2.36. This buffer MUST be empty when the Server Close Drive Request (section 2.2.3.3.2) message has been issued and no drive-specific events have occurred.

Padding (1 byte): An optional, 8-bit unsigned integer intended to allow the client minor flexibility in determining the overall packet length. This field is unused and MUST be ignored.

2.2.3.4.12 Client Drive Lock Control Response (DR_DRIVE_LOCK_RSP)

This message is sent by the client as a response to the Server Drive Lock Control Request (section 2.2.3.3.12).

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
DeviceIoReply (16 bytes)																															
...																															
...																															
Padding																															
...																															

DeviceIoReply (16 bytes): A DR_DEVICE_IOCTLCOMPLETION (section 2.2.1.5) header. The **CompletionId** field of the DR_DEVICE_IOCTLCOMPLETION header MUST match a Device I/O Request (section 2.2.1.4) that has the **MajorFunction** field set to IRP_MJ_LOCK_CONTROL.

Padding (5 bytes): 5 bytes of padding. This field is unused and MUST be ignored.

3 Protocol Details

The following sections specify protocol details, including abstract data models and message processing rules.

3.1 Common Details

3.1.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The organization is provided to explain how the protocol behaves. This document does not mandate that implementations adhere to this model, as long as their external behavior is consistent with that described in this document.

ClientId: Although this field is negotiated in the Server Announce Request (section 2.2.2.2) message, the Client Announce Reply (section 2.2.2.3) message and the Server Client ID Confirm (section 2.2.2.6) message, the protocol never processes this field after the ID has been established.

DeviceId: A unique ID that is maintained by both the client and the server for each device within a session. This unique ID is generated by the client and sent to the server in the Device Announce Header (section 2.2.1.3). For subsequent operations on the devices, both the client and server use this ID to refer to the device.

FileId: A unique ID generated by the client and sent to the server in a Device Create Response (section 2.2.1.5.1). It is used in every packet in which a Device I/O Request (section 2.2.1.4) is a header. The ID is valid until a Device Close Response (section 2.2.1.5.2) is issued by the client.

CompletionId: For I/O request calls, the server generates this unique ID and sends it to the client in the Device I/O Request (section 2.2.1.4). The client and server use this ID, in addition to the **DeviceId**, to refer to the request in subsequent messages. When a request is sent to the client, the server adds it to a list of outstanding requests. When the client completes the request, or when the request is canceled from the server by issuing a Device Close Request (section 2.2.1.4.2), the server removes the entry for the request from the outstanding requests list. This ID is valid until a Device I/O Response (section 2.2.1.5) packet is sent from the client to the server. A response is matched to a request if both the **CompletionId** and the **DeviceId** fields are equal.

ResultCode: The server generates these status codes in a Server Device Announce Response (section 2.2.2.1) message. If the status code is not successful, the device is not redirected and I/O operations are not issued by the server on that device.

ComputerName: This field is sent by the client in a Client Name Request (section 2.2.2.4) message, but the **ComputerName** field does not participate in any protocol decision. Typically, this field is used for display purposes on the server.

Capabilities: The client and server store the capability packets that they receive. Based on the fields of the capability packets, some packets will not be supported, as specified in this protocol.

3.1.2 Timers

No timers are used.

3.1.3 Initialization

A virtual channel **MUST** be established to facilitate protocol operation. The static virtual channel is initialized as part of the basic Remote Desktop Protocol: File System Virtual Channel Extension initialization, by sending and processing a Virtual Channel PDU, as specified in [MS-RDPBCGR] section 3.1.5.2. After establishing the virtual channel this protocol continues its initialization by executing these steps:

1. The server **MUST** send Server Announce Request (section 2.2.2.2): this sets server version and is indication to the client to start the client sequence.
2. The client **MUST** reply with Client Announce Reply (section 2.2.2.3) immediately followed by Client Name Request (section 2.2.2.4): this establishes client version and name.
3. Upon receiving Client Name Request, the server **MUST** send Server Core Capability Request (section 2.2.2.7) followed by Server Client ID Confirm (2.2.2.6): this establishes server capabilities and confirms client version.
4. Upon receiving Server Client ID Confirm, the client **MUST** send Client Core Capability Response (section 2.2.2.8) and Client Device List Announce Request (section 2.2.2.9): this establishes client capabilities and list of devices to be redirected.

3.1.4 Higher-Layer Triggered Events

The announcement of different devices can be triggered by an event, such as when a user has successfully logged on to a terminal server. This behavior ensures that the required devices are visible in the different stages of the logon process. For example, when the protocol is first established, only the smart card devices are announced, because only those devices are required for the logon process. After logon completes, the rest of the devices can be announced to the server. The logged-on event triggers the server to send a Server User Logged On (section 2.2.2.5) packet, which the client can use as an indication that the server is logged on.

The announcement of additional drives by the client is triggered when devices are added to the client machine. After the devices are added to the client machine, the client **SHOULD** announce the new drives to the server using a Client Device List Announce (section 2.2.3.1) message. When the device is removed from the client, the client sends a Client Drive Device List Remove (section 2.2.3.2) message.

I/O requests are generated in response to I/O calls that server applications make on the redirected device.

3.1.5 Message Processing Events and Sequencing Rules

The **DeviceId** field is valid if all of the following conditions are met:

- The **DeviceId** field has been specified in a packet that contains the Device Announce Header (section 2.2.1.3).
- No Client Drive Device List Remove (section 2.2.3.2) has been sent for this **DeviceId**.

The **FileId** field is valid if all of the following conditions are met:

- A Device Create Response has been issued with that **FileId**.
- No Device Close Response has been issued with that ID.

The **CompletionId** field is valid if all of the following conditions are met:

- The server has sent a packet that has a Device I/O Request (section 2.2.1.4) in its header with that ID.
- No packet that has a header Device I/O Response (section 2.2.1.5) has been sent by the client with that ID.

3.1.5.1 Processing I/O Requests and Responses

This protocol connects server-based applications and client file systems such that each component is unaware of the other's local location, as specified in section 1.3. This protocol forwards server requests from the server-based application and returns replies from the client-file system. There are no specific rules implied by this protocol as to how and when a particular message is sent from the server and what the client is to reply. The rules enforced by this protocol are described by the **ClientId**, **CompletionId**, **DeviceId**, and **FileId** fields, as specified in the Abstract Data Model (section 3.1.1) and the processing instructions that follow.

There are several types of I/O requests, as specified in section 2.2.3.3. Each request is identified by its unique **CompletionId** and **DeviceId**. For each request, there is a corresponding reply, as specified in section 2.2.3.4. The **CompletionId** and **DeviceId** in the response MUST match the **CompletionId** and **DeviceId** of the request.

Each request is always initiated from the server's driver, and then sent to the client. The relevant fields for each request are retrieved from the driver. The client forwards the request to the client driver. When the request completes, the client sends an I/O response that contains the output of the request. The response is matched to its request by the **DeviceId** and **CompletionId** fields; that is, those fields MUST match.

In case of sudden termination of the underlying transport, all outstanding requests against the file system drivers are completed on both sides.

3.1.5.2 Processing Packet Errors

When an unrecognized or malformed packet is received by the server or the client, the implementation SHOULD terminate the virtual channel connection. This action SHOULD be taken for any unrecognized message or field values.

If a packet is received with a length shorter than the expected length, the implementation SHOULD terminate the virtual channel connection.

Out-of-sequence packets, or the receipt of multiples of packets that are supposed to be received only once, MAY terminate the virtual channel connection.

There are no timeouts for receiving a reply for any request. A request is considered incomplete until a matching reply is received or the underlying virtual channel connection is terminated.

Error checking for a Shared Header (RDPDR_HEADER):

- If the **Component** field has a value that is not specified by this protocol, the implementation SHOULD terminate the virtual channel connection.
- If the **PacketId** field has a value that is not specified by this protocol, the implementation SHOULD terminate the virtual channel connection.

Error checking for a Capability Header (CAPABILITY_HEADER):

- If the **CapabilityType** field has a value that is not specified by this protocol, the implementation SHOULD terminate the virtual channel connection.

Error checking for a Device Announce Header (DEVICE_ANNOUNCE):

- If the **DeviceType** field has a value that is not specified by this protocol, the server SHOULD send a Server Device Announce Response (DR_CORE_DEVICE_ANNOUNCE_RSP) message with the **ResultCode** field set to STATUS_NOT_SUPPORTED.

Error checking for a Device I/O Request (DR_DEVICE_REQUEST):

- If a request is received that contains a **DeviceId** field that was not announced by the client or has been removed, the request SHOULD be ignored by the implementation.
- If the request contains **MajorFunction** or **MinorFunction** fields that are not described by this protocol, the request SHOULD be completed with a Device I/O Response message that has the **IoStatus** field set to STATUS_UNSUCCESSFUL.
- If the request does not have the **MajorFunction** field set to IRP_MJ_CREATE, and the **FileId** field does not contain a valid value returned in response to a Device Create Request message, or the device has been closed by a Device Close Request message, the implementation SHOULD return a response with the **IoStatus** field set to STATUS_UNSUCCESSFUL.

Error checking for a Device I/O Response (DR_DEVICE_IOCOMPLETION):

- If a response contains a **CompletionId** value that has not been sent or has been already completed, the implementation SHOULD terminate the virtual channel.
- If a response contains a **DeviceId** field that has never been announced or has been removed, the implementation SHOULD terminate the virtual channel.

Error checking for a DR_CORE_CLIENT_ANNOUNCE_RSP packet:

- There is no error checking for the **VersionMinor** and **VersionMajor** fields specified by the client in the DR_CORE_CLIENT_ANNOUNCE_RSP packet. However, the behavior is different depending on the version information, as follows.
 - If the value of VersionMajor on the server is less than the value of VersionMajor specified by the client, then the server does not initiate capability exchange via the DR_CORE_CAPABILITY_REQ packet. Otherwise, it does.
 - If the value of VersionMajor on the server is identical to the value of VersionMajor specified by the client and if the value of VersionMinor is less than 5, then the server does not initiate capability exchange via the DR_CORE_CAPABILITY_REQ packet. If the value of VersionMinor is greater than or equal to 5, then the server initiates capability exchange via the DR_CORE_CAPABILITY_REQ packet.

Note The details for client versions are specified in DR_CORE_SERVER_ANNOUNCE_REQ. The details for server versions are specified in DR_CORE_CLIENT_ANNOUNCE_RSP.

3.1.6 Timer Events

No common timer events are used.

3.1.7 Other Local Events

There are no common local events.

3.2 Client Details

3.2.1 Abstract Data Model

The abstract data model is specified in section 3.1.1.

3.2.2 Timers

No timers are used.

3.2.3 Initialization

Initialization is specified in section 3.1.3.

3.2.4 Higher-Layer Triggered Events

Higher-layer triggered events are specified in section 3.1.4.

3.2.5 Message Processing Events and Sequencing Rules

3.2.5.1 Initialization Messages

3.2.5.1.1 Processing a Server Device Announce Response Message

This response indicates the success or failure of a device announcement in the Client Device List Announce Request. The client does not take any actions that affect the protocol state. This packet informs the client whether the device specified by the **DeviceId** field can be redirected in the future. If the **ResultCode** field is set to STATUS_SUCCESS, the device MUST be redirected; any other value indicates an error.

3.2.5.1.2 Processing a Server Announce Request Message

This request is initiated by the server and is the first packet that goes across this virtual channel. It indicates the server's version number and that the server is ready to start the protocol sequence. If the **VersionMinor** field is less than 12, the client MUST generate a new, unique **ClientId** by drawing a random number. This new **ClientId** MUST be sent in a Client Announce Reply message. If this packet appears after a sequence of other packets, it is a signal that the server has reconnected to a new session and the whole sequence has been reset. The client MUST treat this packet as the beginning of a new sequence. The client MUST also cancel all outstanding requests and release previous references to all devices.

3.2.5.1.3 Sending a Client Announce Reply Message

The client MUST send this reply immediately after receiving the Server Announce Request packet. It sends its own version number in the **VersionMajor** and **VersionMinor** fields. If the value of **VersionMinor** field from the Server Announce Request message was at least 12, the client MUST populate the **ClientId** field of its reply with the same value supplied by the server in the **ClientId** field. Otherwise, the client MUST provide a new, unique value for the **ClientId** field by generating a 32-bit random number. The **ClientId** is valid until a Client Drive Device List Remove packet is sent by the client or the protocol channel is disconnected. After the Client Drive Device List Remove packet is sent, the **ClientIds** in that packet MUST be reused in a subsequent Client Device List Announce packet.

3.2.5.1.4 Sending a Client Name Request Message

The client MUST send this packet immediately after sending the Client Announce Reply packet. In this packet, the client specifies the client computer name in the **ComputerName** field, and the code page in which the name is described.

3.2.5.1.5 Processing a User Logged On Message

This packet indicates that the user on the server is logged on, and that the client MUST now announce devices that are suitable for applications running on the server. Typically, the client sends an additional Client Device List Announce Request with an additional list of devices. If the client does not support this message, the client MUST announce its devices immediately after receiving both the Server Core Capability Request message and the Server Client ID Confirm message.

3.2.5.1.6 Processing a Server Client ID Confirm Message

This packet indicates that the server accepted the client ID that was received in the Client Announce Reply packet, or that the user logged on to the server (see section 3.3.5.1.7). The **ClientId** field of this packet MUST be the same as the **ClientId** field of the Client Announce Reply packet.

3.2.5.1.7 Processing a Server Core Capability Request Message

This packet contains capabilities for every device type supported by this channel. The **numCapabilities** field indicates the number of sub-packets in the **CapabilityMessage**. Each sub-packet has a CAPABILITY_HEADER header, depending on the value of **CapabilityType** in this header. The client MUST reply with its own set of capabilities.

3.2.5.1.8 Sending a Client Core Capability Response Message

The packet is identical to the Server Core Capability Request packet. The client MUST list the capabilities that it can support in this packet.<12> The client MUST send this packet immediately after receiving a Server Core Capability Request packet.

3.2.5.1.9 Sending a Client Device List Announce Request Message

This packet can be sent by the client in one of the following cases:

- Immediately after receiving the User Logged On message.
- After receiving both the Server Core Capability Request and the Server Client ID Confirm messages from the server, if the client does not support the User Logged On message.

This packet can also be sent at any time and any number of times, to announce devices after sending the Client Name Request packet.

This packet MUST contain only devices that have not been announced by previous Client Device List Announce packets.

3.2.5.2 Drive Redirection Messages

This section describes data packets that are specific to drive (file system) redirection.

3.2.5.2.1 Sending a Client Device List Announce Message

The client MAY choose to send announce messages for each file system individually, all in one packet, or mixed with other devices. In all cases, the packet SHOULD start with a standard header, as specified in section 2.2.3.1; and the **DeviceType** in each announce sub-packet MUST be set to RDPDR_DTYP_FILESYSTEM.<13> The client MAY choose to send this packet if a new file system appears at any time, according to the rules defined in section 3.2.5.1.9.

3.2.5.2.2 Sending a Client Drive Device List Remove Message

The client MAY send this packet at any time after receiving the Server Device Announce Response message for the specified file system. Any requests to that device after sending this message MUST be considered invalid and the request will be discarded.<14>

Note The client MUST send the DR_DEVICELIST_REMOVE message for devices that are removed after a session is connected. The server can accept the DR_DEVICE_REMOVE message for any removed device, including file system and port devices. The server MUST also accept reused DeviceIds of devices that have been removed, providing the implementation uses the DR_DEVICE_REMOVE message to do so.

3.2.5.2.3 Processing a Server Create Drive Request Message

This message is processed according to the rules defined in section 3.1.5.1. If the Path field of this request is equal to any of the strings described below, the request MUST be completed with STATUS_ACCESS_DENIED. The comparison is case-insensitive.

Value of Path field	Details
LPT<X>	Where <X> has any value from 1 to 9
COM<X>	Where <X> has any value from 1 to 9
PRN	
AUX	
NUL	
CON	
CLOCK\$	

3.2.5.2.4 Sending a Client Create Drive Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.5 Processing a Server Close Drive Request Message

This message is processed according to the rules defined in section 3.1.5.1. If there are any pending or incomplete I/O requests with this **FileId** that are about to be closed, those requests are canceled. That is, they are completed with an NTSTATUS code STATUS_CANCELLED (0xC0000120) value for the **IoStatus** field in the response.

3.2.5.2.6 Sending a Client Close Drive Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.7 Processing a Server Drive Read Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.8 Sending a Client Drive Read Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.9 Processing a Server Drive Write Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.10 Sending a Client Drive Write Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.11 Processing a Server Drive Control Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.12 Sending a Client Drive Control Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.13 Processing a Server Drive Query Volume Information Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.14 Sending a Client Drive Query Volume Information Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.15 Processing a Server Drive Set Volume Information Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.16 Sending a Client Drive Set Volume Information Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.17 Processing a Server Drive Query Information Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.18 Sending a Client Drive Query Information Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.19 Processing a Server Drive Set Information Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.20 Sending a Client Drive Set Information Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.21 Processing a Server Drive Query Directory Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.22 Sending a Client Drive Query Directory Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.5.2.23 Processing a Server Drive Notify Change Directory Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.24 Sending a Client Drive Notify Change Directory Response Message

This packet is generated according to the rules defined in section 3.1.5.1. There are two distinguishable cases in which this response can indicate success:

- When any of the conditions requested in the Server Drive NotifyChange Directory Request (section 2.2.3.3.11) message are met for an event on the file system. In this case, the **Buffer** field contains the appropriate indication for the events.
- When the file is closed by a Server Close Drive Request (section 2.2.3.3.2). In this case, the **Buffer** field is empty.

3.2.5.2.25 Processing a Server Drive Lock Control Request Message

This message is processed according to the rules defined in section 3.1.5.1.

3.2.5.2.26 Sending a Client Drive Lock Control Response Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.2.6 Timer Events

There are no timer events.

3.2.7 Other Local Events

There are no other local events.

3.3 Server Details

3.3.1 Abstract Data Model

The abstract data model is specified in section 3.1.1.

3.3.2 Timers

No timers are used.

3.3.3 Initialization

Initialization is specified in section 3.1.3.

3.3.4 Higher-Layer Triggered Events

Higher-layer triggered events are specified in section 3.1.4.

3.3.5 Message Processing Events and Sequencing Rules

3.3.5.1 Initialization Messages

3.3.5.1.1 Sending a Server Device Announce Response Message

After the server initializes its virtual file system drivers for each announced device in the Client Device List Announce Request, the server **MUST** send a Server Device Announce Response for each device. The server initializes **ResultCode** with the appropriate NTSTATUS code of the virtual file system driver initialization. NTSTATUS codes are specified in [MS-ERREF] section 2.3.

3.3.5.1.2 Sending a Server Announce Request Message

This is the first packet that the server MUST send after it establishes the transport over the virtual channel. This packet contains version information. The **ClientId** field MUST be set to a unique ID that will not collide with any other connection where this protocol is used.

3.3.5.1.3 Processing a Client Announce Reply Message

The server stores the information that it received in a Client Announce Reply message. Based on the information included in this packet, the server can perform analysis on the supported client version. The **ClientId** field is stored and then later sent to the client in a Server Client ID Confirm message.

3.3.5.1.4 Processing a Client Name Request Message

The server stores the **ComputerName** field into each virtual file system driver.

3.3.5.1.5 Sending a Server User Logged On Message

With this packet, the server indicates that the user is completely logged on. It is sent when the user is logged on, or when the server reconnects to a session with an already logged-on user, immediately after it receives a Client Core Capability Response. This packet is sent only if the client's general capability set has the RDPDR_USER_LOGGEDON_PDU bit set in the **extendedPDU** field.

3.3.5.1.6 Sending a Server Core Capability Request Message

The server MUST send its capability request immediately after it receives the Client Announce Reply message, if the **VersionMinor** field of the Client Announce Reply message is at least 5. <15> If the **VersionMinor** field is less than 5, the client does not support capability exchange. In this case, the server sends the Server Client ID Confirm message.

3.3.5.1.7 Sending a Server Client ID Confirm Message

The server MUST send this packet immediately after receiving the Client Announce Reply message and when all of the following conditions are met:

- The user has logged on to the server.
- The RDPDR_USER_LOGGEDON_PDU bit is not set in the **extendedPDU** field of the Client Core Capability Response.

When the server **VersionMinor** field is less than 5, this packet MUST be sent exactly once, asynchronously with the user logged-on event.

If the client does not have the RDPDR_USER_LOGGEDON_PDU flag set, then this packet MUST be sent again when the user logs on.

The **VersionMajor** and **VersionMinor** fields of this packet are set to the server version numbers.

3.3.5.1.8 Processing a Client Core Capability Response Message

The server stores all client capabilities for later use in deciding what kinds of requests the client supports.

3.3.5.1.9 Processing a Client Device List Announce Message

The server initializes virtual device drivers for each of the announced devices in this packet. The result of the initialization of those device drivers is sent in the Server Device Announce Response message.

The server sends separate Server Device Announce Response messages for each device in the Client Device List Announce message.

3.3.5.2 Drive Redirection Messages

3.3.5.2.1 Processing a Client List Announce Message

The server creates a virtual file system driver for each file system device. If this message contains **DeviceIds** that were previously sent in a Client Device List Announce message and the **DeviceIds** have not been invalidated by a Client Drive Device List Remove message, the protocol **MUST** be terminated.

3.3.5.2.2 Processing a Client Drive Device List Remove Message

The server removes the virtual file system driver for the specified device. If the specified device was not previously announced in a Client Device List Announce message, the Processing a Client Drive Device List Remove message **MUST** be ignored.

3.3.5.2.3 Sending a Server Create Drive Request Message

The server sends the Server Create Drive Request message whenever a new file or directory is being created or when an existing file, directory, or volume is being opened. All the relevant fields are packaged in an appropriate request and are sent to the client.

3.3.5.2.4 Processing a Client Create Drive Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.5 Sending a Server Close Drive Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.6 Processing a Client Close Drive Response Message

This message is processed according to the rules defined in section 3.1.5.1. All pending or incomplete I/O requests for this **FileId** **MUST** be canceled. That is, they **MUST** be completed with an NTSTATUS code STATUS_CANCELLED (0xC0000120).

3.3.5.2.7 Sending a Server Drive Read Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.8 Processing a Client Drive Read Response Message

This message is processed according to the rules defined in section 3.1.5.1. The server **MUST** not send multiple read requests on the same file unless the ENABLE_ASYNCIO flag is set in General Capability Set message. If the flag is not set, then the server **MUST** wait for the read on a particular file to complete before sending the next read on the same file.

3.3.5.2.9 Sending a Server Drive Write Request Message

This packet is generated according to the rules defined in section 3.1.5.1. The server **MUST** not send multiple write requests on the same file unless the ENABLE_ASYNCIO flag is set in General Capability Set message. If the flag is not set, then the server **MUST** wait for the write on a particular file to complete before sending the next write on the same file.

3.3.5.2.10 Processing a Client Drive Write Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.11 Sending a Server Drive Control Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.12 Processing a Client Drive Control Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.13 Sending a Server Drive Query Volume Information Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.14 Processing a Client Drive Query Volume Information Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.15 Sending a Server Drive Set Volume Information Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.16 Processing a Client Drive Set Volume Information Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.17 Sending a Server Drive Query Information Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.18 Processing a Client Drive Query Information Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.19 Sending a Server Drive Set Information Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.20 Processing a Client Drive Set Information Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.21 Sending a Server Drive Query Directory Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.22 Processing a Client Drive Query Directory Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.23 Sending a Server Drive Notify Change Directory Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.24 Processing a Client Drive Notify Change Directory Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.5.2.25 Sending a Server Drive Lock Control Request Message

This packet is generated according to the rules defined in section 3.1.5.1.

3.3.5.2.26 Processing a Client Drive Lock Control Response Message

This message is processed according to the rules defined in section 3.1.5.1.

3.3.6 Timer Events

There are no timer events.

3.3.7 Other Local Events

There are no other local events.

4 Protocol Examples

The following sections describe several operations as used in common scenarios to illustrate the function of the Remote Desktop Protocol: File System Virtual Channel Extension.

4.1 Packet Sequences

Packet sequence with the Server User Logged On message shows a sequence of packets for a client that supports the Server User Logged On message.

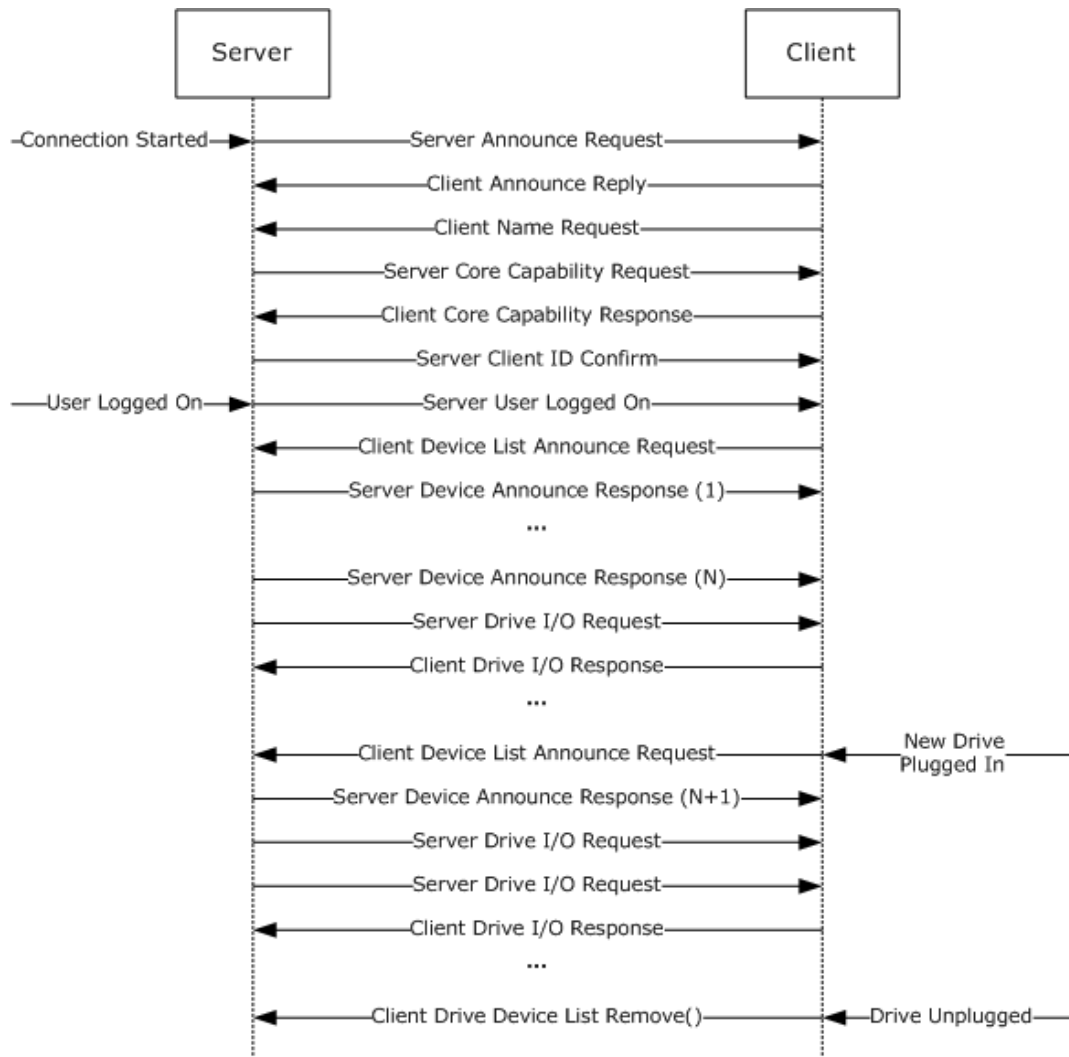

Figure 4: Packet sequence with the Server User Logged On message

Packet sequence without the Server User Logged On message shows the differences in a packet sequence for a client that does not support the Server User Logged On message. Notice that the device announcement can happen completely asynchronously with the user logon to the server.

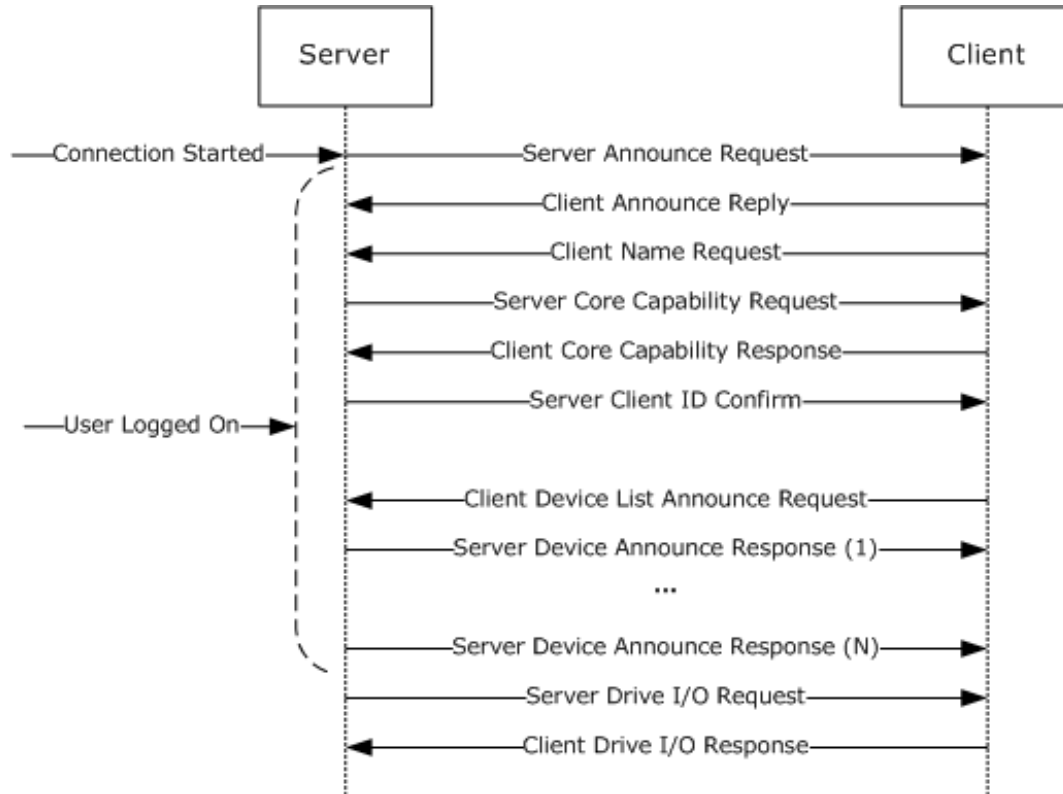

Figure 5: Packet sequence without the Server User Logged On message

4.2 Server Device Announce Response

```

12 bytes, server to client
00000000 72 44 72 64 01 00 00 00 00 00 00 00
72 44      Header->RDPDR_CTYP_CORE = 0x4472
72 64      Header->PAKID_CORE_DEVICE_REPLY = 0x6472
01 00 00 00 DeviceId = 0x00000001
00 00 00 00 ResultCode = 0x00000000
  
```

4.3 Server Announce Request

```

12 bytes, server to client
00000000 72 44 6e 49 01 00 0c 00 01 00 00 00
72 44      Header->RDPDR_CTYP_CORE = 0x4472
6e 49      Header->PAKID_CORE_SERVER_ANNOUNCE = 0x496e
01 00      VersionMajor = 0x0001
0c 00      VersionMinor = 0x000c
01 00 00 00 ClientId = 0x00000001
  
```

4.4 Client Announce Reply

```

12 bytes, client to server
00000000 72 44 43 43 01 00 0c 00 01 00 00 00
72 44      Header->RDPDR_CTYP_CORE = 0x4472
43 43      Header->PAKID_CORE_CLIENTID_CONFIRM = 0x4343
01 00      VersionMajor = 0x0001
  
```

```
0c 00          VersionMinor = 0x000c
01 00 00 00   ClientId = 0x00000001
```

4.5 Client Name Request

```
46 bytes, client to server

5 Security

The following sections specify security considerations for implementers of the Remote Desktop Protocol: File System Virtual Channel Extension.

5.1 Security Considerations for Implementers

There are no security considerations for Remote Desktop Protocol: File System Virtual Channel Extension messages because all static virtual channel traffic is secured by the underlying Remote Desktop Protocol core protocol. For the implemented security-related mechanisms, see [MS-RDPBCGR] section 5.

5.2 Index of Security Parameters

There are no security parameters for the Remote Desktop Protocol: File System Virtual Channel Extension.

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

▪ ~~Windows 2000 operating system~~

- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 2.1: In Windows (unsupported in Windows 2000 operating system, Windows XP and Windows Server 2003), the client advertises the static virtual channel named "RDPSND", as defined in [MS-RDPEA]. If that channel is not advertised, the server will not issue any communication on the "RDPDR" channel.

<2> Section 2.2.1.2: Unsupported in Windows 2000.

<3> Section 2.2.1.3: Unsupported in Windows 2000.

<4> Section 2.2.1.3: Unsupported in Windows 2000.

<5> Section 2.2.1.4: In the Windows implementation, the **MinorFunction** field is not initialized when the **MajorFunction** field is set to IRP_MJ_DEVICE_CONTROL.

<6> Section 2.2.1.4.4: If the client did not advertise a minor version of at least 0x000D in the Client Announce Reply (section 2.2.2.3), then it is not possible to determine whether an offset of 0x7FFFFFFF is, in fact, an offset or an indication to treat the write request as an append operation.

<7> Section 2.2.1.5.1: All Windows versions skip the **Information** field if **IoStatus** is set to 0x00000000 and **DeviceId** has **DeviceType** set to RDPDR_DTYP_PRINT.

<8> Section 2.2.2.2:

Value	Meaning
0x000C	The following versions of Windows send this value when acting as the RDP server: Windows Vista, Windows Vista operating system with Service Pack 1 (SP1), Windows Server 2008, Windows 7, Windows Server 2008 R2, Windows 8, Windows Server 2012, Windows 8.1, Windows Server 2012 R2, Windows 10, and Windows Server 2016.
0x000A	Windows Server 2003 operating system with Service Pack 2 (SP2) sends this value when acting as the RDP server.
0x0006	Windows XP operating system Service Pack 3 (SP3) sends this value when acting as the RDP server.
0x0005	The following versions of Windows send this value when acting as the RDP server: Windows XP, Windows XP operating system Service Pack 1 (SP1), Windows XP operating system Service Pack 2 (SP2), Windows Server 2003, and Windows Server 2003 operating system with Service Pack 1 (SP1).
0x0002	Windows 2000 sends this value when acting as the RDP server.

<9> Section 2.2.2.7.1: Unsupported in Windows 2000, Windows XP, Windows Server 2003, Windows Vista, and Windows Server 2008.

<10> Section 2.2.2.7.5: Unsupported in Windows 2000.

<11> Section 2.2.3.1: Unsupported in Windows 2000.

<12> Section 3.2.5.1.8: Unsupported in Windows 2000.

<13> Section 3.2.5.2.1: Unsupported in Windows 2000.

<14> Section 3.2.5.2.2: Unsupported in Windows 2000.

<15> Section 3.3.5.1.6: Unsupported in Windows 2000.

7 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as ~~New~~, Major, Minor, ~~Editorial~~, or ~~No change~~**None**.

~~The revision class **New** means that a new document is being released.~~

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements ~~or functionality~~.
- ~~The removal of a~~ document ~~from the documentation set~~revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

~~The revision class **Editorial** means that the formatting in the technical content was changed. Editorial changes apply to grammatical, formatting, and style issues.~~

~~The revision class **No change****None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content ~~of the document~~ is identical to the last released version.~~

~~Major and minor changes can be described further using the following change types:~~

- ~~New content added.~~
- ~~Content updated.~~
- ~~Content removed.~~
- ~~New product behavior note added.~~
- ~~Product behavior note updated.~~
- ~~Product behavior note removed.~~
- ~~New protocol syntax added.~~
- ~~Protocol syntax updated.~~
- ~~Protocol syntax removed.~~
- ~~New content added due to protocol revision.~~
- ~~Content updated due to protocol revision.~~
- ~~Content removed due to protocol revision.~~
- ~~New protocol syntax added due to protocol revision.~~
- ~~Protocol syntax updated due to protocol revision.~~
- ~~Protocol syntax removed due to protocol revision.~~
- ~~Obsolete document removed.~~

~~Editorial changes are always classified with the change type **Editorially updated**.~~

Some important terms used in the change type descriptions are defined as follows:

- ~~**Protocol syntax**~~ refers to data elements (such as packets, structures, enumerations, and methods) as well as interfaces.
- ~~**Protocol revision**~~ refers to changes made to a protocol that affect the bits that are sent over the wire.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Tracking number (if applicable) and description	Major change (Y or N) Revision class	Change type
2.2.1.4.4 Device Write Request (DR_WRITE_REQ)	5349 : Updated the Offset field with content to indicate when the write request becomes an append operation.	Y	Content update.
2.2.1.4.4 Device Write Request (DR_WRITE_REQ)	Updated content for this version of Windows and Windows Server.	Y	Content update.
2.2.2.1.3 ClientDevice Announce Reply (DR_CORE_CLIENTHeader (DEVICE_ANNOUNCE_RSP))	5349 : Updated the VersionMajor and VersionMinor fields with content that indicates they are for the file system redirection protocol and included the 0x000D minor version value. Clarified that the maximum device name length should be 7 characters to account for the null terminator in the PreferredDosName field description.	Ymajor	Content update.
2.2.2.3 Client Announce Reply (DR_CORE_CLIENT_ANNOUNCE_RSP)	Updated content for this version of Windows and Windows Server. 6812 : Changed ClientID to ClientId in the ClientId field description.	Yminor	Content update.
2.2.3.4.2.6 Server Client ID Confirm Drive Close Response (DR_CORE_SERVER_CLIENTID_CONFIRMDRIVE_CLOSE_RSP)	6813 : Updated content for this version of Windows the size of the DeviceCloseResponse field from 21 bytes to 20 bytes and Windows Server added the 1 byte Padding field.	Ymajor	Content update.
