

[MS-WSTEP-Diff]:

WS-Trust X.509v3 Token Enrollment Extensions

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation ("this documentation") for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the Patent Map.
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
12/5/2008	0.1	Major	Initial Availability
1/16/2009	0.1.1	Editorial	Changed language and formatting in the technical content.
2/27/2009	0.1.2	Editorial	Changed language and formatting in the technical content.

1 Introduction

The WS-Trust X.509v3 Token Enrollment Extensions are extensions of WS-Trust that are used by a system to request that a certificate be issued.

The communication is initiated by a requesting client who requests a new certificate, retrieval of an issued certificate, or retrieval of a server certificate. The server processes the request and generates a response based on the request type.

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 Glossary

This document uses the following terms:

Abstract Syntax Notation One (ASN.1): A notation to define complex data types to carry a message, without concern for their binary representation, across a network. ASN.1 defines an encoding to specify the data types with a notation that does not necessarily determine the representation of each value. ASN.1 encoding rules are sets of rules used to transform data that is specified in the ASN.1 language into a standard format that can be decoded on any system that has a decoder based on the same set of rules. ASN.1 and its encoding rules were once part of the same standard. They have since been separated, but it is still common for the terms ASN.1 and Basic Encoding Rules (BER) to be used to mean the same thing, though this is not the case. Different encoding rules can be applied to a given ASN.1 definition. The choice of encoding rules used is an option of the protocol designer. ASN.1 is described in the following specifications: [ITUX660] for general procedures; [ITUX680] for syntax specification; [ITUX690] for the Basic Encoding Rules (BER), Canonical Encoding Rules (CER), and Distinguished Encoding Rules (DER) encoding rules; and [ITUX691] for the Packed Encoding Rules (PER). Further background information on ASN.1 is also available in [DUBUISSON].

certificate: When referring to X.509v3 certificates, that information consists of a public key, a distinguished name (DN)~~(3)~~ of some entity assumed to have control over the private key corresponding to the public key in the certificate, and some number of other attributes and extensions assumed to relate to the entity thus referenced. Other forms of certificates can bind other pieces of information.

Certificate Management Messages over CMS (CMC): An internet standard for transport mechanisms for CMS [RFC2797].

certification authority (CA): A third party that issues public key certificates. Certificates serve to bind public keys to a user identity. Each user and certification authority (CA) can decide whether to trust another user or CA for a specific purpose, and whether this trust should be transitive. For more information, see [RFC3280].

Hypertext Transfer Protocol Secure (HTTPS): An extension of HTTP that securely encrypts and decrypts web page requests. In some older protocols, "Hypertext Transfer Protocol over Secure Sockets Layer" is still used (Secure Sockets Layer has been deprecated). For more information, see [SSL3] and [RFC5246].

Public Key Cryptography Standards (PKCS): A group of Public Key Cryptography Standards published by RSA Laboratories.

security token service (STS): A special type of server defined in WS-Trust [WSTrust1.3].

SOAP action: The HTTP request header field used to indicate the intent of the SOAP request, using a URI value. See [SOAP1.1] section 6.1.1 for more information.

SOAP fault: A container for error and status information within a SOAP message. See [SOAP1.2-1/2007] section 5.4 for more information.

SOAP message: An XML document consisting of a mandatory SOAP envelope, an optional SOAP header, and a mandatory SOAP body. See [SOAP1.2-1/2007] section 5 for more information.

Unicode: A character encoding standard developed by the Unicode Consortium that represents almost all of the written languages of the world. The Unicode standard [UNICODE5.0.0/2007] provides three forms (UTF-8, UTF-16, and UTF-32) and seven schemes (UTF-8, UTF-16, UTF-16 BE, UTF-16 LE, UTF-32, UTF-32 LE, and UTF-32 BE).

Web Services Description Language (WSDL): An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.

X.509: An ITU-T standard for public key infrastructure subsequently adapted by the IETF, as specified in [RFC3280].

XML: The Extensible Markup Language, as described in [XML1.0].

XML namespace: A collection of names that is used to identify elements, types, and attributes in XML documents identified in a URI reference [RFC3986]. A combination of XML namespace and local name allows XML documents to use elements, types, and attributes that have the same names but come from different sources. For more information, see [XMLNS-2ED].

XML Schema (XSD): A language that defines the elements, attributes, namespaces, and data types for XML documents as defined by [XMLSCHEMA1/2] and [W3C-XSD] standards. An XML schema uses XML syntax for its language.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

The WS-Trust X.509v3 Token Enrollment Extensions (WSTEP) defines the token enrollment profile for WS-Trust [WSTrust1.3] to allow a client to request X.509v3 certificates.

Existing certificate authorities (CAs) support Abstract Syntax Notation One (ASN.1) formats such as PKCS#10 ([RFC2986]), PKCS#7 ([RFC3852]), or CMC ([RFC2797]) to encode a certificate request, and those requests are carried in an existing protocol, such as Windows Client Certificate Enrollment Protocol [MS-WCCE] or Cisco's SCEP ([SCEP]). WSTEP also carries those requests from the client to the issuer.

WSTEP provides for issuance, renewal, and delayed-issuance scenarios for X.509v3 digital certificates. The server is known in WS-Trust [WSTrust1.3] terminology as a Security Token Service (STS).

The WS-Trust protocol [WSTrust1.3] definition provides the framework for the STS and for enrollment profile extensions. A typical client interacts with a STS with a request security token (RST) message. The STS responds to a client request security token message with a request security token response (RSTR) or a SOAP fault.

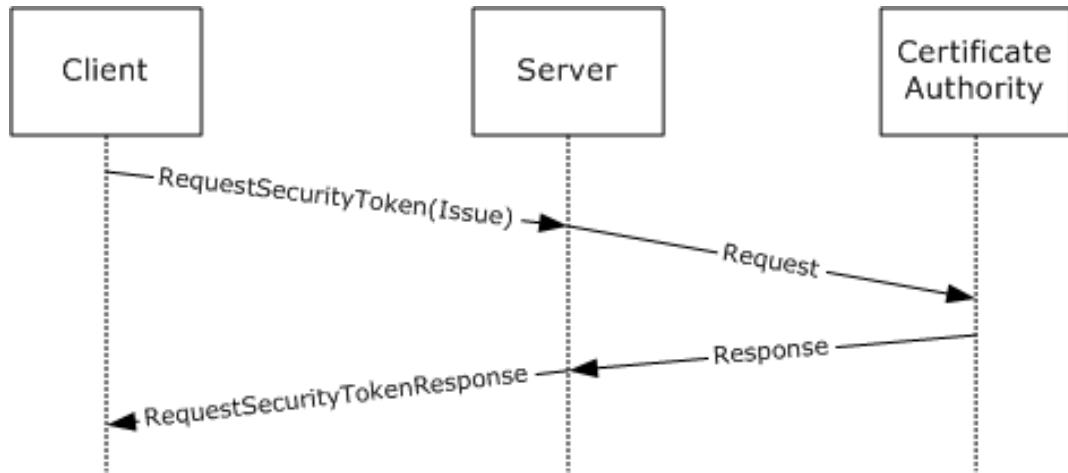

Figure 1: Typical sequence for certificate enrollment

The following figure shows a scenario in which a request cannot be satisfied immediately. In this scenario, the client makes a request, and the server reply indicates that the request is pending some other action. The client then queries the request at a later time, presumably after any conditions for its satisfaction have been met, and receives a reply that the request was issued, rejected, or is still pending.

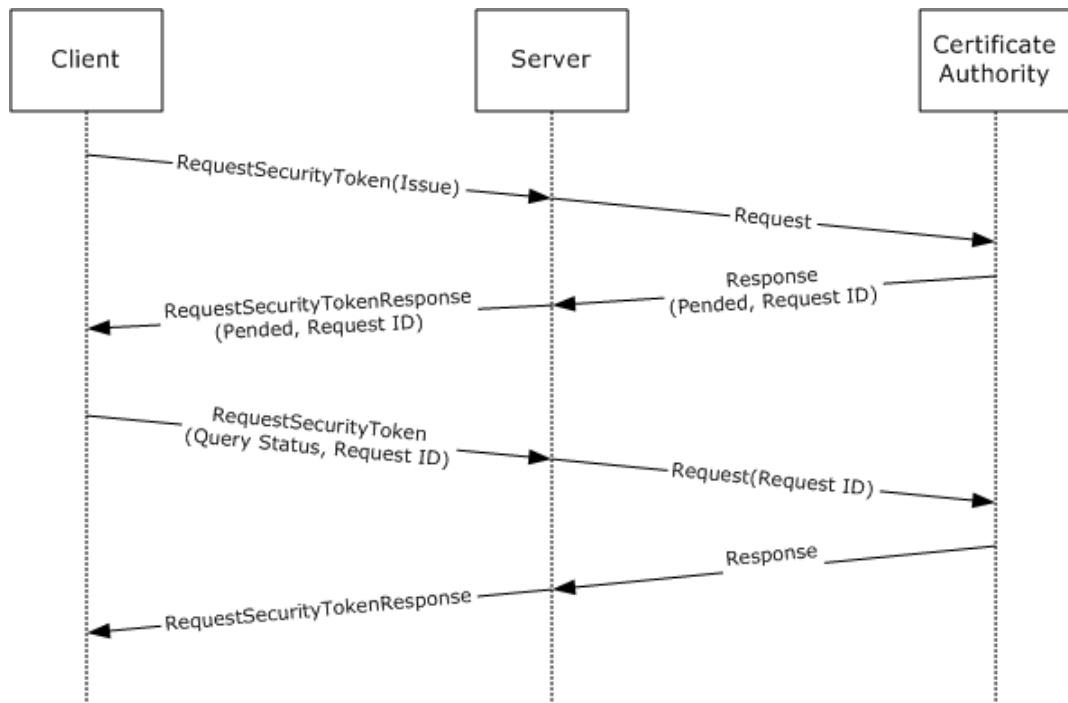

Figure 2: Typical sequence for a pended certificate enrollment request

In some circumstances, the client request could be rejected. In these instances, the STS responds with a SOAP fault. The following figure shows the typical sequence.

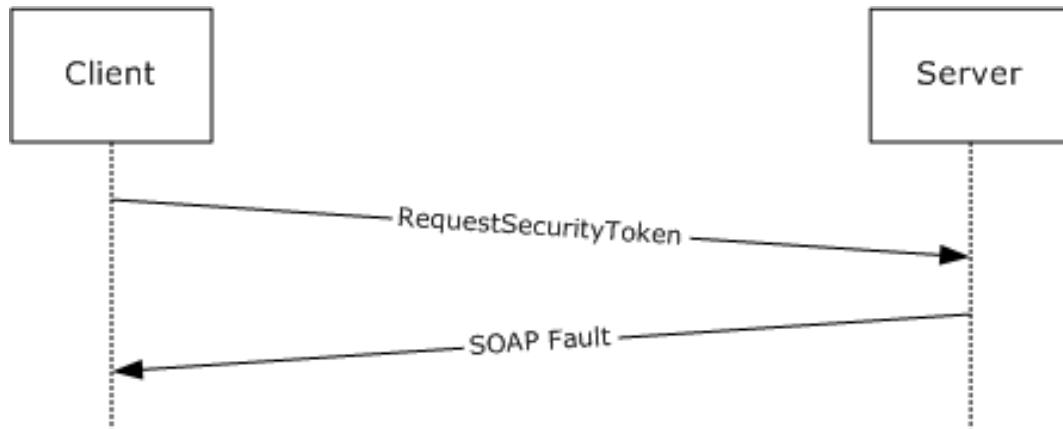

Figure 3: Typical sequence for a rejected certificate renewal request

The following figure is an example of a message exchange for a renewal request. A renewal request uses an existing certificate and requests a new lifespan. From the point of view of the WSTEP protocol, this is the same as an issue request, as the message format is unchanged.

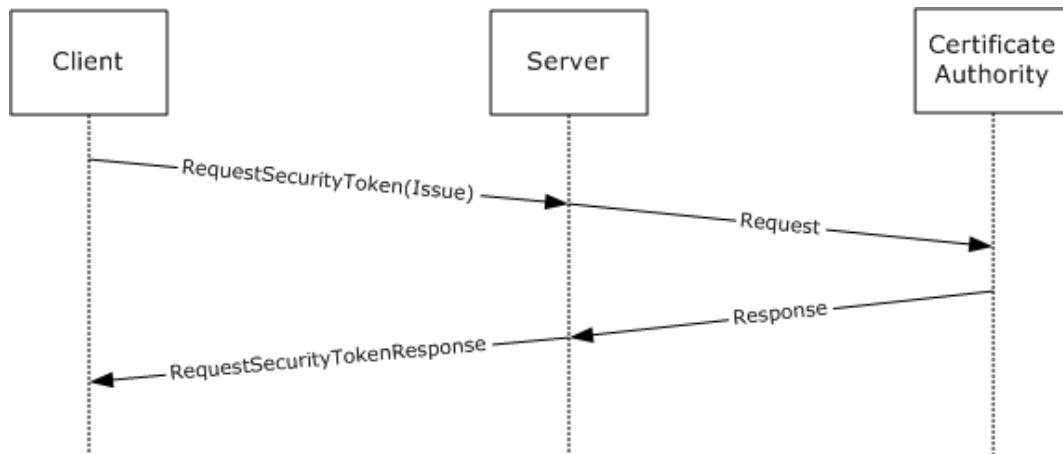

Figure 4: Typical sequence for a certificate renewal request

1.4 Relationship to Other Protocols

The following figure shows the WSTEP Protocol stack diagram.

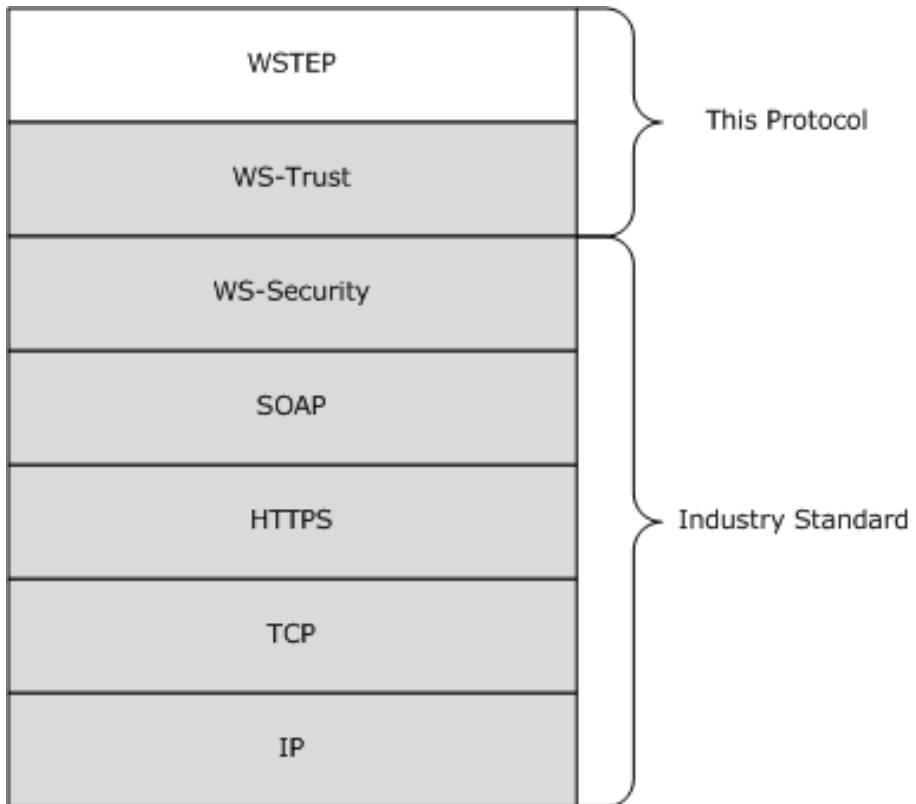

Figure 5: WSTEP Protocol stack diagram

The WSTEP protocol specification is a profile of the WS-Trust Protocol [WSTrust1.3] and makes use of the SOAP and Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) protocols for messaging and security.

1.5 Prerequisites/Preconditions

The WSTEP protocol specification facilitates the issuance of X.509v3 certificates. A server implementation of the protocol requires the functionality of a certificate authority, capable of interpreting requests in at least one of PKCS#7, PKCS#10, or Certificate Management Messages over CMS (CMC).

1.6 Applicability Statement

The WSTEP protocol specification is applicable only for requests for X.509v3 certificates.

1.7 Versioning and Capability Negotiation

The WSTEP protocol specification does not include versioning and capability negotiation.

1.8 Vendor-Extensible Fields

The WSTEP protocol specification does not include any vendor-extensible fields. WSTEP adheres to the WS-Trust 1.3 [WSTrust1.3] provided extension points.

1.9 Standards Assignments

None.

2 Messages

2.1 Transport

SOAP version 1.2 MUST be used for messaging for the WSTEP protocol. HTTPS protocol MUST be used as the transport.

2.2 Common Message Syntax

This section contains common definitions used by this protocol. The syntax of the definitions uses the XML schema as defined in [XMLSCHEMA1] and [XMLSCHEMA2], and the Web Services Description Language (WSDL) as defined in [WSDL].

2.2.1 Namespaces

This specification defines and references various XML namespaces, using the mechanisms specified in [XMLNS]. Although this specification associates a specific XML namespace prefix for each XML namespace that is used, the choice of any particular XML namespace prefix is implementation-specific and not significant for interoperability.

Prefixes and XML namespaces used in this specification are as follows.

Prefix	Namespace URI	Reference
xs	http://www.w3.org/2001/XMLSchema	[XMLSCHEMA1]
wst	http://docs.oasis-open.org/ws-sx/ws-trust/200512	[WSTrust1.3]
auth	http://schemas.xmlsoap.org/ws/2006/12/authorization	[XMLSCHEMA1]
wsu	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd	
wsse	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd	
wstep	http://schemas.microsoft.com/windows/pki/2009/01/enrollment	This document

2.2.2 Messages

None.

2.2.3 Elements

This specification does not define any common XML schema element definitions.

2.2.4 Complex Types

This specification does not define any common XML schema complex type definitions.

2.2.5 Simple Types

The WSTEP protocol specification does not define any common XML schema simple type definitions.

2.2.6 Attributes

The WSTEP protocol specification does not define any common XML schema attribute definitions.

2.2.7 Groups

The WSTEP protocol specification does not define any common XML schema group definitions.

2.2.8 Attribute Groups

The WSTEP protocol specification does not define any common XML schema attribute group definitions.

3 Protocol Details

The client side of this protocol is a simple pass-through. No additional timers or other state is required on the client side of this protocol. Calls made by the higher-layer protocol or application are passed directly to the transport layer, and the results returned by the transport are passed directly back to the higher-layer protocol or application.

This section addresses the message processing model for the protocol. It includes related information required by an implementation to successfully send and consume protocol messages.

3.1 SecurityTokenService Server Details

The **SecurityTokenService** hosts a message endpoint that receives **RequestSecurityToken** messages. When received, the server processes the client request and sends it to the certificate authority. Upon receiving a response from the certificate authority, a response is generated, and the server sends either a **RequestSecurityTokenResponse** message or a SOAP fault. When the message has been sent to the client, the server returns to the waiting state.

Figure 6: Security token service state model

The items of information that are communicated between the server and the certificate authority are specified in this section, but the method of communication used, including timeout and error handling (local API, local remote procedure call (RPC), or some other protocol) is not specified.

The certificate authority MAY have additional requirements that MUST be met in order to issue an X.509v3 certificate, such as manager approval, payment processing, or validation of request information. In these instances, a certificate authority response indicating the issuance is pending.

3.1.1 Abstract Data Model

A server supporting the WSTEP protocol maintains a relationship to an issuer which processes messages submitted by the server. When communicating with requestors, a server can support a variety of languages.

Issuer: An address of a certificate authority (CA). The format of the stored address is specific to the implementation and to the form of communication used between the Issuer and the Server.

SupportedLanguages: A list of language identifiers supported by the server. The set of languages are of type `xml:lang` and defined in [RFC3066].

DefaultLanguage: The default language for the server. `DefaultLanguage` is of type `xml:lang`, and the set of supported languages is defined in [RFC3066].

3.1.1.1 Authentication

The WS-Trust X.509v3 Token Enrollment Extensions use the authentication provisions in WS-Security ([WSS]) for the X.509v3 Security Token issuer to authenticate the X.509v3 Security Token requestor. This section defines the schema used to express the credential descriptor for each supported credential type.

3.1.1.1.1 Kerberos Authentication

Authentication using Kerberos is done at the transport layer.

3.1.1.1.2 X.509v3 Certificate Authentication

Authentication using X.509v3 certificates is done at the transport level using Transport Level Security (TLS) 1.2 as defined in [RFC5246].

3.1.1.1.3 Username and Password Authentication

The username and password credential is provided in a request message using the WS-Security Username Token Profile 1.0. The username is provided as defined in section 3.1 of the Ws-Security document [WSSUTP].

3.1.1.1.4 No (Anonymous) Authentication

If no authentication is provided at either the transport layer or the message layer, the request is considered to be anonymous. Anonymous authentication is supported only for renewal requests, where the signature from the existing certificate on the request object serves as authentication for the X.509v3 Security Token requestor.

3.1.2 Timers

None.

3.1.3 Initialization

The `SupportedLanguages` object MUST be initialized with the set of languages that the server supports.

The *DefaultLanguage* parameter MUST be initialized with the language that is to be used by the server when a request does not define a language preference, or the preference is not in *SupportedLanguages.<1>*

3.1.4 Message Processing Events and Sequencing Rules

Operation	Description
wst:RequestSecurityToken2	The wst:RequestSecurityToken2 operation is the sole operation in the WSTEP protocol. It provides the mechanism for certificate enrollment requests, retrieval of pending certificate status, and the request of the server key exchange certificate. The wst:RequestSecurityToken2 operation is defined in WS-Trust 1.3 [WSTrust1.3].

3.1.4.1 wst:RequestSecurityToken2

The wst:RequestSecurityToken2 operation provides the mechanism for certificate enrollment requests, retrieval of pending certificate status, and the request of the server key exchange certificate. The wst:SecurityTokenService port and wst:RequestSecurityToken2 operation are defined in the [WSTrust1.3] WSDL wsdl:portType definition.

```
<wsdl:operation name="RequestSecurityToken2">
  <wsdl:input message="wst:RequestSecurityTokenMsg" />
  <wsdl:output message="wst:RequestSecurityTokenResponseCollectionMsg" />
</wsdl:operation>
```

WSTEP makes use of the wst:RequestSecurityToken2 operation. The wst:RequestSecurityToken operation defined in the SecurityTokenService operation is not used. The **wst:RequestSecurityTokenMsg** message consists of a single object definition: the client request. The client request is made using the acceptable SOAP actions as defined in section 3.1.4.2 and RequestType values, as defined in section 3.1.4.1.2.7.

3.1.4.1.1 Messages

The following WSDL message definitions are specific to this operation.

3.1.4.1.1.1 wst:RequestSecurityTokenMsg

The wst:RequestSecurityTokenMsg is an incoming message, and is defined in WS-Trust 1.3 [WSTrust1.3] WSDL.

wst:RequestSecurityToken: An instance of a **wst:RequestSecurityTokenType** complex type as defined in section 3.1.4.1.3.3. The **wst:RequestSecurityToken** element defines the client request and the required information for it to be processed.

3.1.4.1.1.2 wst:RequestSecurityTokenResponseCollectionMsg

The wst:RequestSecurityTokenResponseCollectionMsg is an outgoing message, and is defined in WS-Trust 1.3 [WSTrust1.3] WSDL.

wst:RequestSecurityTokenResponseCollectionMsg: An instance of a **wst:RequestSecurityTokenResponseCollection** element as defined in section 3.1.4.1.2.6. This element contains the results of the client request.

3.1.4.1.2 Elements

3.1.4.1.2.1 wstep:CertificateEnrollmentWSDetail

The **wstep:CertificateEnrollmentWSDetail** element is used to convey additional information to a client as part of the SOAP fault structure when a server returns a SOAP fault.

```
<xs:element name="CertificateEnrollmentWSDetail" nillable="true"
type="wstep:CertificateEnrollmentWSDetailType" />
```

wstep:CertificateEnrollmentWSDetail: An instance of a `<wstep:CertificateEnrollmentWSDetailType>` as defined in section 3.1.4.1.3.7. If there is no additional information, the **wstep:CertificateEnrollmentWSDetail** SHOULD be omitted in the SOAP fault.

3.1.4.1.2.2 DispositionMessage

```
<xs:element name="DispositionMessage"
type="wstep:DispositionMessageType" nillable="true" />
```

DispositionMessage: An instance of a `DispositionMessageType` object as defined in section 3.1.4.1.3.1.

3.1.4.1.2.3 wst:KeyExchangeToken

The `<wst:KeyExchangeToken>` element is defined in WS-Trust 1.3 [WSTrust1.3] section 8.4.

wst:KeyExchangeToken: The `wst:KeyExchangeToken` element provides a key exchange token that can be used in certificate enrollment requests that include the private key.

3.1.4.1.2.4 RequestID

```
<xs:element name="RequestID"
type="xs:string" nillable="true"/>
```

RequestID: A string identifier used to identify a request.

3.1.4.1.2.5 wst:RequestSecurityToken

The `<wst:RequestSecurityToken>` element is defined in WS-Trust 1.3 [WSTrust1.3], section 3.1.

wst:RequestSecurityToken: An instance of a `wst:RequestSecurityTokenType` object as specified in section 3.1.4.1.3.3.

3.1.4.1.2.6 RequestSecurityTokenResponseCollection

The `RequestSecurityTokenResponseCollection` is defined in WS-Trust 1.3 [WSTrust1.3], section 3.2.

RequestSecurityTokenResponseCollection: An instance of a `wst:RequestSecurityTokenResponseCollectionType` object as specified in section 3.1.4.1.3.5.

3.1.4.1.2.7 wst:RequestType

The `<wst:RequestType>` element is defined in [WSTrust1.3] section 3.1.

wst:RequestType: An instance of a `<wst:RequestTypeOpenEnum>` object as defined in [WSTrust1.3] XML schema definition (XSD).

The <wst:RequestType> MUST have one of the following values:

```
"http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue"  
"http://schemas.microsoft.com/windows/pki/2009/01/enrollment/QueryTokenStatus"  
"http://docs.oasis-open.org/ws-sx/ws-trust/200512/KET"
```

If the <wst:RequestType> has any other value, the server MUST respond with a SOAP fault.

3.1.4.1.2.8 wst:TokenType

The <TokenType> element is defined in [WSTrust1.3], section 3.1.

wst:TokenType: For the X.509v3 enrollment extension to WS-Trust, the <wst:tokentype> element MUST be http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-x509-token-profile-1.0#X509v3.

3.1.4.1.3 Complex Types

The following XML schema complex type definitions are specific to this operation.

3.1.4.1.3.1 DispositionMessageType

The DispositionMessageType is an extension to the string type that allows an attribute definition of the language for the string. The DispositionMessageType is used to provide additional information about the server processing.

```
<xs:complexType name="DispositionMessageType">  
  <xs:simpleContent>  
    <xs:extension base="xs:string">  
      <xs:attribute ref="xml:lang" use="optional" />  
    </xs:extension>  
  </xs:simpleContent>  
</xs:complexType>
```

xs:string: The string element contains the literal string disposition message returned from the server. The string element contains an xml:lang attribute that defines the language for the string. The language SHOULD be provided for each string element instance.

xml:lang: The language reference xml:lang, indicating the natural or formal language the string element content is written in.

3.1.4.1.3.2 wst:RequestedSecurityTokenType

The wst:RequestedSecurityTokenType is defined in WS-Trust XML schema definition (XSD) [WSTrust1.3Schema].

```
<xs:complexType name="RequestedSecurityTokenType">  
  <xs:sequence>  
    <xs:any namespace="#any" processContents="lax" />  
  </xs:sequence>  
</xs:complexType>
```

The WSTEP extends wst: RequestedSecurityTokenType with two additional elements.

```
<xs:element ref="wsse:BinarySecurityToken" />
```

```
<xs:element ref="wsse:SecurityTokenReference" />
```

wsse:BinarySecurityToken: The wsse:BinarySecurityToken element contains the issued certificate. The issued certificate follows the encoding and data structure defined in [MS-WCCE] section 2.2.2.8.

wsse:SecurityTokenReference: A URI reference used to indicate where a pended Certificate Request can be retrieved. The server MUST provide its own URI as the value of the <wsse:BinarySecurityTokenReference> element as specified in [WSTrust1.3] section 4.2.

3.1.4.1.3.3 wst:RequestSecurityTokenType

The **wst:RequestSecurityTokenType** complex type contains the elements for the security token request in the RequestSecurityTokenMsg message. It is the client-provided object for a certificate enrollment request. **wst:RequestSecurityTokenType** is defined in the WS-Trust [WSTrust1.3] XML schema definition (XSD).

```
<xs:complexType name="RequestSecurityTokenType">
  <xs:annotation>
    <xs:documentation>
      Actual content model is non-deterministic, hence wildcard. The following shows intended content model:
    <xs:element ref='wst:TokenType' minOccurs='0' />
    <xs:element ref='wst:RequestType' />
    <xs:element ref='wsp:AppliesTo' minOccurs='0' />
    <xs:element ref='wst:Claims' minOccurs='0' />
    <xs:element ref='wst:Entropy' minOccurs='0' />
    <xs:element ref='wst:Lifetime' minOccurs='0' />
    <xs:element ref='wst:AllowPostdating' minOccurs='0' />
    <xs:element ref='wst:Renewing' minOccurs='0' />
    <xs:element ref='wst:OnBehalfOf' minOccurs='0' />
    <xs:element ref='wst:Issuer' minOccurs='0' />
    <xs:element ref='wst:AuthenticationType' minOccurs='0' />
    <xs:element ref='wst:KeyType' minOccurs='0' />
    <xs:element ref='wst:KeySize' minOccurs='0' />
    <xs:element ref='wst:SignatureAlgorithm' minOccurs='0' />
    <xs:element ref='wst:Encryption' minOccurs='0' />
    <xs:element ref='wst:EncryptionAlgorithm' minOccurs='0' />
    <xs:element ref='wst:CanonicalizationAlgorithm' minOccurs='0' />
    <xs:element ref='wst:ProofEncryption' minOccurs='0' />
    <xs:element ref='wst:UseKey' minOccurs='0' />
    <xs:element ref='wst:SignWith' minOccurs='0' />
    <xs:element ref='wst:EncryptWith' minOccurs='0' />
    <xs:element ref='wst:DelegateTo' minOccurs='0' />
    <xs:element ref='wst:Forwardable' minOccurs='0' />
    <xs:element ref='wst:Delegatable' minOccurs='0' />
    <xs:element ref='wsp:Policy' minOccurs='0' />
    <xs:element ref='wsp:PolicyReference' minOccurs='0' />
    <xs:any namespace='##other' processContents='lax' minOccurs='0' maxOccurs='unbounded' />
  </xs:documentation>
  </xs:annotation>
  <xs:sequence>
    <xs:any namespace="##any" processContents="lax" minOccurs="0" maxOccurs="unbounded" />
  </xs:sequence>
  <xs:attribute name="Context" type="xs:anyURI" use="optional" />
  <xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>
```

WSTEP extends <wst:RequestSecurityTokenType> with the following elements:

```
<xs:element ref="wsse:BinarySecurityToken" minOccurs="0"
```

```

maxOccurs="1" />
<xs:element ref="auth:AdditionalContext" minOccurs="0"
maxOccurs="1" />
<xs:element ref="wst:RequestKET" minOccurs="0" maxOccurs="1" />
<xs:element ref="wstep:RequestID" minOccurs="0" maxOccurs="1" />

```

Only the elements specified below are used in WSTEP. Any element received that is not specified below SHOULD be ignored.

wst:TokenType: Refers to the wst:TokenType definition in section 3.1.4.1.2.8.

wst:RequestType: Refers to the wst:RequestType definition in section 3.1.4.1.2.7. The wst:RequestType is used to identify the type of the security token request.

wst:RequestKET: Used when requesting a key exchange token as defined in [WSTrust1.3] section 8.4.

wsse:BinarySecurityToken: Provides the DER ASN.1 representation of the certificate request. The type of token is defined by the wst:TokenType element. For the X.509v3 enrollment extension the wst:TokenType MUST be specified as in section 3.1.4.1.2.8. The certificate request follows the formatting from [MS-WCCE] section 2.2.2.6. The EncodingType attribute of the wsse:BinarySecurityToken element MUST be set to base64Binary.

auth:AdditionalContext: The auth:AdditionalContext element is used to provide extra information in a wst:RequestSecurityToken message. It is an optional element, and SHOULD be omitted if there is no extra information to be passed.

wstep:RequestID: An instance of **wstep:RequestID** as specified in section 3.1.4.1.2.4.

~~WSTEP extends <wst:RequestSecurityTokenType> with an additional attribute:~~

```

<xs:attribute name="PreferredLanguage" type="xs:language"
use="optional" />

```

~~Only the attribute specified below is used in WSTEP. Any attribute received that is not specified below SHOULD be ignored.~~

~~wstep:PreferredLanguage: The wstep:PreferredLanguage attribute defines the preferred language to be used in a server response.~~

3.1.4.1.3.4 wst:RequestSecurityTokenResponseType

The wst:RequestSecurityTokenResponseType contains the elements that are part of a server response to a wst:RequestSecurityToken message. wst:RequestSecurityTokenResponseType is defined in the WS-Trust [WSTrust1.3] XML schema definition (XSD).

```

<xs:complexType name="RequestSecurityTokenResponseType">
  <xs:annotation>
    <xs:documentation>
      Actual content model is non-deterministic, hence wildcard. The following shows intended content model:
    </xs:documentation>
    <xs:element ref='wst:TokenType' minOccurs='0' />
    <xs:element ref='wst:RequestType' />
    <xs:element ref='wst:RequestedSecurityToken' minOccurs='0' />
    <xs:element ref='wsp:AppliesTo' minOccurs='0' />
    <xs:element ref='wst:RequestedAttachedReference' minOccurs='0' />
    <xs:element ref='wst:RequestedUnattachedReference' minOccurs='0' />
    <xs:element ref='wst:RequestedProofToken' minOccurs='0' />
    <xs:element ref='wst:Entropy' minOccurs='0' />
    <xs:element ref='wst:Lifetime' minOccurs='0' />

```

```

<xs:element ref='wst:Status' minOccurs='0' />
<xs:element ref='wst:AllowPostdating' minOccurs='0' />
<xs:element ref='wst:Renewing' minOccurs='0' />
<xs:element ref='wst:OnBehalfOf' minOccurs='0' />
<xs:element ref='wst:Issuer' minOccurs='0' />
<xs:element ref='wst:AuthenticationType' minOccurs='0' />
<xs:element ref='wst:Authenticator' minOccurs='0' />
<xs:element ref='wst:KeyType' minOccurs='0' />
<xs:element ref='wst:KeySize' minOccurs='0' />
<xs:element ref='wst:SignatureAlgorithm' minOccurs='0' />
<xs:element ref='wst:Encryption' minOccurs='0' />
<xs:element ref='wst:EncryptionAlgorithm' minOccurs='0' />
<xs:element ref='wst:CanonicalizationAlgorithm' minOccurs='0' />
<xs:element ref='wst:ProofEncryption' minOccurs='0' />
<xs:element ref='wst:UseKey' minOccurs='0' />
<xs:element ref='wst:SignWith' minOccurs='0' />
<xs:element ref='wst:EncryptWith' minOccurs='0' />
<xs:element ref='wst:DelegateTo' minOccurs='0' />
<xs:element ref='wst:Forwardable' minOccurs='0' />
<xs:element ref='wst:Delegatable' minOccurs='0' />
<xs:element ref='wsp:Policy' minOccurs='0' />
<xs:element ref='wsp:PolicyReference' minOccurs='0' />
<xs:element ref='wsp:PolicySet' minOccurs='0' />
<xs:any namespace='##other' processContents='lax' minOccurs='0' maxOccurs='unbounded'
/>
</xs:documentation>
</xs:annotation>
<xs:sequence>
<xs:any namespace="##any" processContents="lax" minOccurs="0" maxOccurs="unbounded" />
</xs:sequence>
<xs:attribute name="Context" type="xs:anyURI" use="optional" />
<xs:anyAttribute namespace="##other" processContents="lax" />
</xs:complexType>

```

WSTEP extends the wst:RequestSecurityTokenType with the following elements:

```

<xs:element ref="wstep:DispositionMessage" />
<xs:element ref="wsse:BinarySecurityToken" minOccurs="0" maxOccurs="1" />
<xs:element ref="wstep:RequestID" minOccurs="0" maxOccurs="1" />
<xs:element ref="wst:KeyExchangeToken" minOccurs="0" maxOccurs="1" />
/>

```

Only the elements documented as follows are used by WSTEP. Any element received that is not documented as follows SHOULD be ignored.

wst:TokenType: Refers to the TokenType definition in section 3.1.4.1.2.8.

wstep:DispositionMessage: Refers to the definition in section 3.1.4.1.2.2. The wstep:DispositionMessage element is used to convey any additional server disposition information as part of the response message.

wsse:BinarySecurityToken: Refers to the wsse:BinarySecurityToken definition in section 3.1.4.1.3.2.

wst: KeyExchangeToken: Refers to the wst:KeyExchangeToken definition in section 3.1.4.1.2.3.

wst:RequestedSecurityToken: An instance of a wst:RequestedSecurityTokenType object as defined in section 3.1.4.1.3.2.

wstep:RequestID: An instance of a **wstep:RequestID** as defined in section 3.1.4.1.2.4 that conveys the request identifier of the originating request.

3.1.4.1.3.5 wst:RequestSecurityTokenResponseType

The `<wst:RequestSecurityTokenResponseCollectionType>` is defined in the [WSTrust1.3] XML schema definition (XSD) as a collection of one or more `<wst:RequestSecurityTokenResponse>` elements. The WS-Trust X.509v3 Token Enrollment Extensions further constrain the [WSTrust1.3] definition and the `<wst:RequestSecurityTokenResponseCollection>` collection MUST contain at most one `<wst:RequestSecurityTokenResponse>` element.

```

<xs:complexType name="RequestSecurityTokenResponseCollectionType">
  <xs:annotation>
    <xs:documentation>
      The <code><wst:RequestSecurityTokenResponseCollection></code> element (RSTRC) MUST be used to return a security token or response to a security token request on the final response.</xs:documentation>
    </xs:annotation>
    <xs:sequence>
      <xs:element ref="wst:RequestSecurityTokenResponse" minOccurs="1" maxOccurs="unbounded" />
    </xs:sequence>
    <xs:anyAttribute namespace="#other" processContents="lax" />
  </xs:complexType>

```

wst:RequestSecurityTokenResponse: An instance of a `wst:RequestSecurityTokenResponseType` object. The `<wst:RequestSecurityTokenResponseCollectionType>` MUST contain only one `<RequestSecurityTokenResponse>` element.

3.1.4.1.3.6 wst:RequestTypeEnum

The `<wst:RequestTypeEnum>` is defined in WS-Trust [WSTrust1.3] XML schema definition (XSD). WSTEP defines the following values for `<wst:RequestTypeEnum>`.

```
"http://schemas.microsoft.com/windows/pki/2009/01/enrollment/QueryTokenStatus"
```

WSTEP makes use of the Key Exchange Token request type defined in [WSTrust1.3] section 10:

```
"http://docs.oasis-open.org/ws-sx/ws-trust/200512/KET"
```

and the issue request type defined in [WSTrust1.3] XML schema definition (XSD):

```
"http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue"
```

3.1.4.1.3.7 wstep:CertificateEnrollmentWSDetailType

The `<wstep:CertificateEnrollmentWSDetailType>` contains additional information pertaining to error conditions.

```

<xs:complexType name="CertificateEnrollmentWSDetailType">
  <xs:sequence>
    <xs:element minOccurs="0" maxOccurs="1" name="BinaryResponse" nillable="true" type="xs:string" />
    <xs:element minOccurs="0" maxOccurs="1" name="ErrorCode" nillable="true" type="xs:int" />
    <xs:element minOccurs="0" maxOccurs="1" name="InvalidRequest" nillable="true" type="xs:boolean" />
    <xs:element minOccurs="0" maxOccurs="1" name="RequestID" type="xs:string" nillable="true" />
  </xs:sequence>
</xs:complexType>

```

wstep:BinaryResponse: The wstep:BinaryResponse element is used to provide a response if the Issuer generates one. If there is no response to provide, the wstep:BinaryResponse element MUST be nil.

wstep:ErrorCode: An integer value representing a server error. If there is no error to provide, wstep:ErrorCode MUST be specified as nil.

wstep:InvalidRequest: If the request is denied by the Issuer the server MUST return true. For other errors the wstep:InvalidRequest SHOULD be false.

wstep:RequestID: If the Issuer provides a wstep:RequestID to the server, it MUST be provided to a client. If no wstep:RequestID is provided by the Issuer, the wstep:RequestID element must be specified as nil.

3.1.4.1.4 Attributes

There are no attributes that are specific to this operation.

3.1.4.2 Processing Rules

An incoming SOAP message MUST be processed to evaluate the SOAP actions and authentication information.

If the user is authenticated successfully using the provided authentication information, message processing MUST continue, and the authentication information SHOULD be provided to the Issuer. If the authentication fails, the server MUST respond with a SOAP fault.

If the SOAP action is "http://schemas.microsoft.com/windows/pki/2009/01/enrollment/RST/wstep" the server must follow the Request Security Token Processing Rules per section 3.1.4.2.1.

If the SOAP action is "http://docs.oasis-open.org/ws-sx/ws-trust/200512/RST/KET" the server must follow the Key Exchange Token Processing Rules per section 3.1.4.2.2.

If any other SOAP action is defined, the server SHOULD respond with a SOAP fault.

3.1.4.2.1 WSTEP Action: Request Security Token Processing Rules

A <wst:RequestSecurityTokenMsg> MUST contain a <wst:RequestType> element as defined in section 3.1.4.1.2.7. If the <wst:RequestType> element is absent, nil, or undefined, the server MUST respond with a SOAP fault.

If a **wstep:PreferredLanguage** attribute is not present in a <RequestTokenType> object, or the value is not in SupportedLanguages, the server SHOULD use DefaultLanguage.

If the <wst:RequestType> is "http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue", the server MUST process the request per section 3.1.4.2.1.1.

If the <wst:RequestType> is "http://schemas.microsoft.com/windows/pki/2009/01/enrollment/QueryTokenStatus" the server MUST process the request per section 3.1.4.2.1.2.

If the <wst:RequestType> is any other value, the server MUST respond with a SOAP fault.

3.1.4.2.1.1 New and Renewal Request Processing

A wst:RequestSecurityToken message with a wst:RequestType value of "http://docs.oasis-open.org/ws-sx/ws-trust/200512/Issue" is used for the purposes of issuing an X.509v3 certificate or for renewal of an existing X.509v3 certificate.

For this type of message, a server has additional syntax constraints on the request message.

wsse:BinarySecurityToken: If the wsse:BinarySecurityToken element is absent or undefined, the server MUST respond with a SOAP fault.

wstep:RequestID: If the **wstep:RequestID** element is present and defined, the server SHOULD ignore it.

The server MUST provide the **wsse:BinarySecurityToken** to the Issuer and SHOULD provide the **auth:AdditionalContext** (see section 3.1.4.1.3.3) to the Issuer.

If the Issuer responds with an error, the server MUST respond with a SOAP fault. If the Issuer indicates the issuance is pending, the server MUST use the Issuer response to generate a pending **wst:RequestSecurityTokenResponseCollectionMsg** message. If the Issuer responds with an issued certificate, the server MUST respond with a **wst:RequestSecurityTokenResponseCollectionMsg** message providing the issued certificate.

3.1.4.2.1.2 QueryTokenStatus Request Processing

A **wst:RequestSecurityToken** message with a <wst:RequestType> of "http://schemas.microsoft.com/windows/pki/2009/01/enrollment/QueryTokenStatus" is used to retrieve an issued certificate or check the status of a certificate request that was pending.

For this type of message, the server has additional syntax constraints on the request message.

The **wstep:RequestID** element is a null-terminated Unicode string that contains a certificate request identifier (as defined in section 3.1.4.1.2.4). If the <wstep:RequestID> element is absent, defined as nil, or contains no value the server MUST return a SOAP fault.

The server MUST provide the **wstep:RequestID** to the Issuer.

If the Issuer responds with an error, the server MUST respond with a SOAP fault. If the Issuer indicates the issuance is pending, the server MUST use the Issuer response to generate a pending **wst:RequestSecurityTokenResponseCollectionMsg** message. If the Issuer responds with an issued certificate, the server MUST respond with a **wst:RequestSecurityTokenResponseCollectionMsg** message providing the issued certificate.

3.1.4.2.2 KET Action: Request Security Token Processing Rules

A **wst:RequestSecurityTokenMsg** MUST contain a <wst:RequestType> element as defined in section 3.1.4.1.2.7. If the <wst:RequestType> element is absent, nil, or undefined, the server MUST respond with a SOAP fault.

If the <wst:RequestType> is "http://docs.oasis-open.org/ws-sx/ws-trust/200512/KET" the server MUST process the request per section 3.1.4.2.2.1.

If the <wst:RequestType> is any other value, the server MUST respond with a SOAP fault.

3.1.4.2.2.1 Key Exchange Token Request Processing

A RequestSecurityToken message of wst:RequestType of "http://docs.oasis-open.org/ws-sx/ws-trust/200512/KET" is used to retrieve the Key Exchange Token.

For this type of message, a server has additional syntax constraints on the **wst:RequestSecurityTokenMsg** message.

If the <wst:RequestKET> element is absent, the server MUST return a SOAP fault.

The server requests the Key Exchange Token from the issuer. If the issuer responds with an error, the server MUST respond with a SOAP fault. Otherwise, the server uses the Issuer response to generate a **wst:RequestSecurityTokenResponseCollectionMsg** message.

The `<wst:RequestSecurityTokenResponse>` element in the server response follows the [WSTrust1.3] definition in section 8, but for key exchange in the WSTEP protocol, the `<wst:KeyExchangeToken>` element MUST be present, and provides the key exchange token provided from the Issuer.

3.1.5 Timer Events

None.

3.1.6 Other Local Events

None.

4 Protocol Examples

4.1 RequestSecurityToken Request/Response Message Sequence

In the following message sequence, the username/password authentication headers have been included in the message sequences for clarity.

4.1.1 Standard Certificate Request

4.1.1.1 RequestSecurityToken Message (Issue Request)

```
<s:Envelope xmlns:a="http://www.w3.org/2005/08/addressing"

5 Security

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Full WSDL

The WSTEP protocol is a profile extension of WS-Trust1.3. As such, it does not have a WSDL.

WS-Trust 1.3 WSDL: The full WSDL for WS-Trust can be found at: <http://docs.oasis-open.org/wss-ws-trust/200512/ws-trust-1.3.wsdl>.

WSTEP XML Schema: For the convenience of implementation, the XML Schema is provided here.

```
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:wstep="http://schemas.microsoft.com/windows/pki/2009/01/enrollment"
    targetNamespace="http://schemas.microsoft.com/windows/pki/2009/01/enrollment"
    elementFormDefault="qualified">

    <xs:import namespace="http://www.w3.org/XML/1998/namespace"
        schemaLocation="http://www.w3.org/2001/xml.xsd" />

    <xs:element name="DispositionMessage" type="wstep:DispositionMessageType" nillable="true"
    />
    <xs:complexType name="DispositionMessageType">
        <xs:simpleContent>
            <xs:extension base="xs:string">
                <xs:attribute ref="xml:lang" use="optional" />
            </xs:extension>
        </xs:simpleContent>
    </xs:complexType>
    <xs:element name="CertificateEnrollmentWSDetail" nillable="true"
    type="wstep:CertificateEnrollmentWSDetailType" />
    <xs:complexType name="CertificateEnrollmentWSDetailType">
        <xs:sequence>
            <xs:element minOccurs="0" maxOccurs="1" name="BinaryResponse" nillable="true"
            type="xs:string" />
            <xs:element minOccurs="0" maxOccurs="1" name="ErrorCode" nillable="true" type="xs:int"
            />
            <xs:element minOccurs="0" maxOccurs="1" name="InvalidRequest" nillable="true"
            type="xs:boolean" />
            <xs:element minOccurs="0" maxOccurs="1" name="RequestID" type="xs:string"
            nillable="true" />
        </xs:sequence>
    </xs:complexType>
    <xs:element name="RequestID" type="xs:string" nillable="true" />
    <xs:attribute name="PreferredLanguage" type="xml:language" use="optional"/>
</xs:schema>
```

7 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs.

- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system
- Windows 10 operating system
- Windows Server 2016 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 3.1.3: Windows servers set the *DefaultLanguage* parameter to the installed language.

8 Change Tracking

No table of This section identifies changes is available. The that were made to this document is either new or has had no changes since its the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dochelp@microsoft.com.

Section	Description	Revision class
3.1.4.1.3.3 wst:RequestSecurityTokenType	6792 : Removed invalid PreferredLanguage attribute and supporting content.	major
6 Appendix A: Full WSDL	6792 : Removed invalid PreferredLanguage attribute: <xss:attribute name="PreferredLanguage" type="xml:language" use="optional"/>.	major
