

[MS-WUSP-Diff]:

Windows Update Services: Client-Server Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation (“this documentation”) for protocols, file formats, data portability, computer languages, and standards support. Additionally, overview documents cover inter-protocol relationships and interactions.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you can make copies of it in order to develop implementations of the technologies that are described in this documentation and can distribute portions of it in your implementations that use these technologies or in your documentation as necessary to properly document the implementation. You can also distribute in your implementation, with or without modification, any schemas, IDLs, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications documentation.
- **No Trade Secrets.** Microsoft does not claim any trade secret rights in this documentation.
- **Patents.** Microsoft has patents that might cover your implementations of the technologies described in the Open Specifications documentation. Neither this notice nor Microsoft's delivery of this documentation grants any licenses under those patents or any other Microsoft patents. However, a given Open Specifications document might be covered by the Microsoft [Open Specifications Promise](#) or the [Microsoft Community Promise](#). If you would prefer a written license, or if the technologies described in this documentation are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplg@microsoft.com.
- **License Programs.** To see all of the protocols in scope under a specific license program and the associated patents, visit the [Patent Map](#).
- **Trademarks.** The names of companies and products contained in this documentation might be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events that are depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than as specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications documentation does not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments, you are free to take advantage of them. Certain Open Specifications documents are intended for use in conjunction with publicly available standards specifications and network programming art and, as such, assume that the reader either is familiar with the aforementioned material or has immediate access to it.

Support. For questions and support, please contact dochelp@microsoft.com.

Revision Summary

Date	Revision History	Revision Class	Comments
3/2/2007	1.0	New	Version 1.0 release
4/3/2007	1.1	Minor	Version 1.1 release
5/11/2007	1.2	Minor	Version 1.2 release
6/1/2007	1.2.1	Editorial	Changed language and formatting in the technical content.
7/3/2007	2.0	Major	Changed to unified format; updated technical content.
8/10/2007	3.0	Major	Updated and revised the technical content.
9/28/2007	4.0	Major	Updated and revised the technical content.
10/23/2007	4.0.1	Editorial	Changed language and formatting in the technical content.
1/25/2008	4.0.2	Editorial	Changed language and formatting in the technical content.
3/14/2008	4.0.3	Editorial	Changed language and formatting in the technical content.
6/20/2008	5.0	Major	Updated and revised the technical content.
7/25/2008	6.0	Major	Updated and revised the technical content.
8/29/2008	6.0.1	Editorial	Changed language and formatting in the technical content.
10/24/2008	7.0	Major	Updated and revised the technical content.

1 Introduction

The Windows Server Update Services: Client-Server Protocol enables machines to discover and download software updates over the Internet by using the SOAP and HTTP protocols (as specified in [SOAP1.1], [SOAP1.2-1/2003], [SOAP1.2-2/2003], and [RFC2616]).

Sections 1.5, 1.8, 1.9, 2, and 3 of this specification are normative. All other sections and examples in this specification are informative.

1.1 (Updated Section) Glossary

This document uses the following terms:

AND group: A conjunctive clause in a disjunctive normal form (DNF) formula. For example, in the formula $(A \text{ AND } B) \text{ OR } (A \text{ AND } C)$, the clauses " $(A \text{ AND } B)$ " and " $(A \text{ AND } C)$ " are AND groups.

client computer: (1) A computer that receives and applies settings from a Group Policy Object (GPO), as specified in [MS-GPOL].

(2) A computer that gets its updates from an update server. A client can be a desktop computer, a server, or the update server. For more information, see [MS-WUSP] and [MS-WSUSSS].

ClientIdString: A globally unique string that identifies a client machine to the update server. It is between 1 and 255 characters in length and contains only the letters a-z, the digits 0-9, or the hyphen.

conjunctive normal form (CNF): A logical formula consisting of a conjunction of disjunctions of terms in which no disjunction contains a conjunction. For example, $A \text{ OR } (B \text{ AND } C)$ is not in CNF, whereas the equivalent $(A \text{ OR } B) \text{ AND } (A \text{ OR } C)$ is in CNF.

Cryptographic Application Programming Interface (CAPI) or CryptoAPI: The Microsoft cryptographic application programming interface (API). An API that enables application developers to add authentication, encoding, and encryption to Windows-based applications.

deployment: An administratively specified decision to make a specific update revision available to a specific target group.

disjunctive normal form (DNF): A logical formula consisting of a disjunction of conjunctions of terms in which no conjunction contains a disjunction. For example, $A \text{ AND } (B \text{ OR } C)$ is not in DNF, whereas the equivalent $(A \text{ AND } B) \text{ OR } (A \text{ AND } C)$ is in DNF.

globally unique identifier (GUID): A term used interchangeably with universally unique identifier (UUID) in Microsoft protocol technical documents (TDs). Interchanging the usage of these terms does not imply or require a specific algorithm or mechanism to generate the value. Specifically, the use of this term does not imply or require that the algorithms described in [RFC4122] or [C706] must be used for generating the GUID. See also universally unique identifier (UUID).

locale: An identifier, as specified in [MS-LCID], that specifies preferences related to language. These preferences indicate how dates and times are to be formatted, how items are to be sorted alphabetically, how strings are to be compared, and so on.

man in the middle (MITM): An attack that deceives a server or client into accepting an unauthorized upstream host as the actual legitimate host. Instead, the upstream host is an attacker's host that is manipulating the network so that the attacker's host appears to be the desired destination. This enables the attacker to decrypt and access all network traffic that would go to the legitimate host. The attacker is able to read, insert, and modify at-will messages between two hosts without either party knowing that the link between them is compromised.

metadata: XML-formatted data that defines the characteristics of an update, including its title, description, rules for determining whether the update is applicable to a client computer, and instructions for installing the update content.

Microsoft Windows Installer (MSI): A file format that contains information used by Windows Installer to install software and software updates.

prerequisite graph: A directed graph with revisions as vertices and prerequisite relationships as edges.

quick fix engineering (QFE): Quick fixes by engineering, also called QFEs, are a small update designed to address a specific software bug. They are uniquely numbered to enable each fix to be identified easily by its associated QFE number.

Reporting Web Service: A Web service used by clients to report status to the server.

revision ID: A compact, server-assigned, 32-bit identifier for a revision that is used to identify the revision during client/server communication.

Secure Sockets Layer (SSL): A security protocol that supports confidentiality and integrity of messages in client and server applications that communicate over open networks. SSL supports server and, optionally, client authentication using X.509 certificates [X509] and [RFC5280]. SSL is superseded by Transport Layer Security (TLS). TLS version 1.0 is based on SSL version 3.0 [SSL3].

self-update: A process by which a client first communicates with the update server to detect updates to the executable files that implement the client role on computers running Windows, and then applies those updated executable files before carrying on further communication.

self-update content directory: A location on the update server containing update content files for the update client that is identified by an HTTP URL and exposed to clients.

SHA-1: An algorithm that generates a 160-bit hash value from an arbitrary amount of input data, as described in [RFC3174]. SHA-1 is used with the Digital Signature Algorithm (DSA) in the Digital Signature Standard (DSS), in addition to other algorithms and standards.

SHA1 hash: A hashing algorithm defined in [FIPS180] that was developed by the National Institute of Standards and Technology (NIST) and the National Security Agency (NSA).

SHA-256: An algorithm that generates a 256-bit hash value computed from the hashing function described in [FIPS180-3], an arbitrary amount of input data.

SimpleAuth Web Service: A Web service on the server that is used to authorize what clients should get metadata for what revisions.

SOAP: A lightweight protocol for exchanging structured information in a decentralized, distributed environment. SOAP uses XML technologies to define an extensible messaging framework, which provides a message construct that can be exchanged over a variety of underlying protocols. The framework has been designed to be independent of any particular programming model and other implementation-specific semantics. SOAP 1.2 supersedes SOAP 1.1. See [SOAP1.2-1/2003].

target group: A named collection of client computers whose members are defined administratively.

UncPath: The location of a file in a network of computers, as specified in Universal Naming Convention (UNC) syntax.

update: The combination of metadata and associated content for a software update. An update is identified by a GUID.

update category: A group of updates. Each update belongs to zero or more update categories. An update category can be a product category that contains updates for a particular product, or a classification category that contains updates of a particular classification (for example, all security updates).

update content directory: A location on the update server containing update content files that is identified by an HTTP URL and exposed to clients.

update metadata: A combination of XML-formatted metadata and associated content that contains information about an update.

update server: A computer that implements the Windows Server Update Services: Server-Server Protocol or the Windows Server Update Services: Client-Server Protocol to provide updates to client computers and other update servers.

virtual directory: An HTTP URL that represents the root of a location where content can be published administratively.

web service: A software entity that responds to SOAP messages ([SOAP1.1],[WSDL]).

Web Services Description Language (WSDL): An XML format for describing network services as a set of endpoints that operate on messages that contain either document-oriented or procedure-oriented information. The operations and messages are described abstractly and are bound to a concrete network protocol and message format in order to define an endpoint. Related concrete endpoints are combined into abstract endpoints, which describe a network service. WSDL is extensible, which allows the description of endpoints and their messages regardless of the message formats or network protocols that are used.

Windows Server Update Services (WSUS): An optional component that enables a machine to operate as an update server.

Windows Update Agent (WUA): A component originally introduced in the Windows 2000 Server operating system Service Pack 3 (SP3) operating system that enables a computer to operate as a client of an update server.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as defined in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

Links to a document in the Microsoft Open Specifications library point to the correct section in the most recently published version of the referenced document. However, because individual documents in the library are not updated at the same time, the section numbers in the documents may not match. You can confirm the correct section numbering by checking the Errata.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.3 Overview

The Windows Server Update Services (WSUS) family of protocols provides support for central publication and distribution of software updates from server machines to client machines, and for hierarchical synchronization of available software components between servers.

This protocol enables client machines to determine available, applicable software updates, and to download those updates for installation. This protocol is a SOAP-based protocol that uses HTTP 1.1 as its transport and includes four distinct phases.

1. **Self-Update:** The client consults the server to determine if updated executable files are available for the client implementation of this protocol. If so, the client updates itself to operate using the updated executable files before continuing to communicate with the server.
2. **Metadata Synchronization:** The client synchronizes update metadata from the update server by calling a sequence of web service methods, as specified in section 3.1.5. The metadata describes various characteristics of the update including its title, description, rules for determining if the update is applicable to a computer, and instructions for installing the update content.

- To reduce network overhead and increase performance, the protocol facilitates the caching of update metadata on clients.
 - To further reduce the amount of update metadata that clients need to synchronize, update metadata is divided into fragments. Each client synchronizes only the fragments that it needs. In particular:
 - The client invokes the SyncUpdates (section 2.2.2.2.4) method, which returns to the client a "core" fragment. This fragment contains sufficient update metadata for a client to evaluate if the update content is required.
 - If the client determines that update content is required, it then invokes the GetExtendedUpdateInfo (section 2.2.2.2.6) method to obtain additional metadata fragments.
3. **Content Synchronization:** The client can request update content comprised of any files associated with the updates required by the client.
 4. **Reporting:** The client reports events to the server that provide information on its update-related activities (for example, content download succeeded or failed; content install succeeded or failed). Reports are generated asynchronously from the rest of the protocol.

A UML sequence diagram can be found in section 3.1.5.

This specification details the protocol mechanisms that enable clients to download self-update binaries, synchronize update metadata, and download update content. It also details the protocol mechanisms for enabling clients to report events to servers.

1.4 Relationship to Other Protocols

The reporting and metadata synchronization protocols include web services that use SOAP (as specified in [SOAP1.1]) over HTTP or HTTPS (as specified in [RFC2616]) for communication. The self-update and content synchronization protocols use HTTP 1.1 ([RFC2616]).

SimpleAuth, Client, and Reporting Web Services	Content Directory and Self-update Tree
SOAP	BITS Upload Protocol [MC-BUP] (Optional)
HTTP(S)	
TCP	
IP	

Figure 1: Relationship between protocols related to this protocol

Content download (both update content and self-update content directory) uses HTTP 1.1 HEAD and GET (Range) requests (as specified in [RFC2616] sections 9.3 and 9.4).

This specification is closely related to the Windows Server Update Services: Server-Server Protocol, as specified in [MS-WSUSSS], which defines mechanisms for synchronizing updates within a hierarchical configuration of update servers.

1.5 Prerequisites/Preconditions

This protocol imposes the following requirement on server implementations.

- This document specifies how the binaries and metadata are distributed using the Client-Server Communications Protocol. It does not specify the format of the binaries or metadata themselves, but it assumes that the metadata is well-formed XML and is compatible with the XPATH queries specified in section 3.1.1.1 for populating the server data model. In all other respects, the binaries and metadata are treated as opaque by the server.

This protocol imposes the following requirement on client implementations.

- Clients are required to be configured to obtain updates from the server. This configuration can be performed manually or, in managed environments, by an appropriate form of centralized machine configuration.

1.6 Applicability Statement

This protocol is applicable in environments where there is a need for centralized, systematic distribution of software updates to managed client computer (2).

1.7 Versioning and Capability Negotiation

This specification covers versioning issues in the following areas.

Client protocol versions: There are different versions of the client side of the protocol. The latest client protocol version is specified in section 2.2.2.2.1. Differences in behavior due to client protocol versions are specified in several sections:

- GetConfig (section 2.2.2.2.1)
- SyncUpdates (section 2.2.2.2.4)
- GetCookie (section 2.2.2.2.2)

Server protocol versions: There are different versions of the server side of the protocol. The latest server protocol version is specified in section 2.2.2.2.1. Differences in behavior due to server protocol versions are specified in several sections:

- GetConfig (section 3.1.5.2)
- GetCookie (section 3.1.5.4)
- SyncUpdates (section 3.1.5.7)
- StartCategoryScan (section 3.1.5.6)

Supported transports: All versions of the protocol use HTTP and SOAP for communications.

Capability negotiation: As specified in section 1.3, clients initiate communication by obtaining updated executable files, which implement the most recent protocol behavior required by the server. This process is specified in section 2.1. In some instances, client behavior depends on the server protocol version. Those are specified in this document.

1.8 Vendor-Extensible Fields

This protocol does not define any vendor-extensible fields.

1.9 Standards Assignments

This protocol has not received any standards assignments.

2 Messages

This protocol MUST be carried out over SOAP (as specified in [SOAP1.1]) and HTTP (as specified in [RFC2616]) and consists of the following set of web services and virtual directories.

- **Update content directory:** A virtual directory, as specified in section 2.2.2.5, which MUST be populated with update content files. The server provides this virtual directory only as a container of files, which are accessible by clients through HTTP GET and HEAD requests.
- **Self-update content directory:** A virtual directory containing the client self-update binaries, as specified in section 2.2.2.5, which MUST be populated with self-update content files. The server provides this virtual directory only as a container of files, which are accessible by clients through HTTP GET and HEAD requests.<2>
- **SimpleAuth Web service:** A web service that clients consult to obtain cached state for use by servers in restricting availability of updates to groups of clients, as specified in section 2.2.2.1.
- **Client Web service:** A web service that synchronizes metadata to the client, as specified in section 2.2.2.2.
- **Reporting Web service:** A web service that clients contact to report selected events containing information on their update activity, as specified in section 2.2.2.3.

The following sections specify the use of the transports listed above and the syntax of these web services.

2.1 Transport

This protocol is carried out over a set of web services and virtual directories.

- Each web service MUST support Simple Object Access Protocol (SOAP) [SOAP1.1] over HTTP over TCP/IP [RFC2616]. Each web service SHOULD support HTTPS for securing its communication with clients.<3>
- Each virtual directory MUST support HTTP over TCP/IP. Each virtual directory SHOULD support HTTPS.

The following TCP ports MUST be exposed by the server as endpoints for the HTTP over TCP/IP transport.

- **commonPort:** Used for self-update and web services communication.<4>
- **contentPort:** Used by the virtual directory that contains content.<5>

The following virtual directories MUST be exposed by the server as endpoints for the HTTP and SOAP over HTTP transports.

Update content directory: This virtual directory MUST be exposed at URL
`http://serverUrl:[contentPort]/Content`

Self-update content directory: This virtual directory, MUST be exposed at URL
`http://serverUrl:[commonPort]/SelfUpdate<6>`

SimpleAuth Web service: This virtual directory, as specified in section 2.2.2.1, MUST be exposed at URL `http[s]://serverUrl:[commonPort]/SimpleAuthWebService/SimpleAuth.asmx`

Client Web service: This virtual directory, as specified in section 2.2.2.2, MUST be exposed at URL
`http[s]://serverUrl:[commonPort]/ClientWebService/Client.asmx`

Reporting Web service: This virtual directory, as specified in section 2.2.2.3, MUST be exposed at URL `http[s]://serverUrl:[commonPort]/ReportingWebService/ReportingWebService.asmx`

Windows Server Update Services: Client-Server Protocol version 0.9 is a legacy version of the protocol that requires the following:

- Requires that `commonPort` be configured to port 80.
- Requires an additional virtual directory at URL `http://serverUrl:[commonPort]`, which MUST be populated with self-update configuration files.

The server SHOULD self-update over a configurable `commonPort`.

To optimize network bandwidth when invoking client Web service and SimpleAuth Web service methods, the client implementation SHOULD add `xpress` to the HTTP "Accept-Encoding" request-header to request `xpress` compression. If the client requests `xpress` compression, the update server SHOULD encode the response using the requested format, as specified in 2.1.1.1.

A client implementation MAY request another type of compression by specifying the encoding format in the HTTP Accept-Encoding request-header field ([RFC2616] section 14.3). If the client requests another type of compression, the update server MAY encode the response using the requested format.

2.1.1 Xpress Compression

To compress an input stream of bytes using Xpress Compression, the server MUST first segment the input stream into a sequence of blocks. The original, uncompressed size of each block MUST NOT be greater than 65535 bytes.

Each block MUST then be compressed and encoded using the `CompressOrDecompressWin2k3` procedure, as specified in section 2.1.1.1. The compressed size of each block MUST NOT be greater than 65535 bytes. The compressed blocks MUST be output in sequence, each prefixed with a header.

The header MUST be in the following format.

original	compressed
-----------------	-------------------

original: A signed, 32-bit integer indicating the original, uncompressed size, in bytes, of the block that follows. The encoding MUST be little-endian.

compressed: A signed, 32-bit integer indicating the compressed size, in bytes, of the block that follows. The encoding MUST be little-endian.

2.1.1.1 CompressOrDecompressWin2k3

```
procedure CompressOrDecompressWin2k3(  
    inputBuffer: sequence of BYTE,  
    inputSize: DWORD  
    ref outputBuffer: sequence of BYTE,  
    comp: BOOLEAN)
```

Informative summary of behavior: The `CompressOrDecompressWin2k3` procedure compresses or decompresses data using the compression algorithm LZ77 (section 2.1.1.1.1) and the basic encoding algorithm DIRECT2 (section 2.1.1.1.2). The procedure has the following parameters:

- *inputBuffer:* A sequence of BYTE containing data to compress or decompress.
- *inputSize:* The DWORD value that indicates the size of *inputBuffer* in bytes.

- *outputBuffer*: A sequence of BYTE that is an empty buffer. Compressed or decompressed data is filled into this buffer.
- *comp*: A Boolean indicating whether to compress (*comp*=TRUE) or decompress (*comp*=FALSE) the *inputBuffer*.

2.1.1.1.1 LZ77 Compression Algorithm

The LZ77 Compression Algorithm is used to analyze input data and determine how to reduce the size of that input data by replacing redundant information with metadata. Sections of the data that are identical to sections of the data that have been encoded are replaced by a small amount of metadata that indicates how to expand those sections again. The encoding algorithm is used to take that combination of data and metadata and serialize it into a stream of bytes that can later be decoded and decompressed.

Compression Algorithm Terminology

The following terms are associated with the compression algorithm. Some of the terms also apply to the DIRECT2 Encoding Algorithm defined in section 2.1.1.1.2.

input stream: The sequence of bytes to be compressed.

byte: The basic data element in the input stream.

coding position: The position of the byte in the input stream that is currently being coded (the beginning of the lookahead buffer).

lookahead buffer: The byte sequence from the coding position to the end of the input stream.

window: A buffer of size W that indicates the number of bytes from the coding position backward. The window is empty at the beginning of the compression, then grows to size W as the input stream is processed. Once it reaches size W, it then "slides" along with the coding position.

pointer: Information about the starting offset of the match in the window (referred to as "B" in the example later in this section) and its length (referred to as "L" in the example later in this section). The starting offset is expressed as the count of bytes from the coding position backwards into the window. The length is the number of bytes to read forward from the starting offset.

The length expressed by the pointer can be longer than the starting offset. This indicates that the match repeats by returning back to the starting offset after reaching the coding position.

A null pointer indicates no match and is expressed as a starting offset of 0 and a length of 0.

match: The string that is used to find a match of the byte sequence between the lookahead buffer and the window.

Using the Compression Algorithm

To use the LZ77 Compression Algorithm:

1. Set the coding position to the beginning of the input stream.
2. Find the longest match in the window for the lookahead buffer.
3. If a match is found, output the pointer P. Move the coding position (and the window) L bytes forward.
4. If a match is not found, output a null pointer and the first byte in the lookahead buffer. Move the coding position (and the window) one byte forward.
5. If the lookahead buffer is not empty, return to step 2.

Compression Process

The compression algorithm searches the window for the longest match with the beginning of the lookahead buffer and then outputs a pointer to that match. Because even a 1-byte match might not be found, the output cannot only contain pointers. The compression algorithm solves this problem by outputting after the pointer the first byte in the lookahead buffer after the match. If no match is found, the algorithm outputs a null-pointer and the byte at the coding position.

Compression Process Example

The following table shows the input stream that is used for this compression example. The bytes in the input, "AABCBBABC", occupy the first nine positions of the stream.

Input stream

Position	1	2	3	4	5	6	7	8	9
Byte	A	A	B	C	B	B	A	B	C

The following table shows the output from the compression process. The table includes the following columns:

Step: Indicates the number of the encoding step. A step in the table finishes every time that the encoding algorithm makes an output. With the compression algorithm, this process happens in each pass through step 3.

Position: Indicates the coding position. The first byte in the input stream has the coding position 1.

Match: Shows the longest match found in the window.

Byte: Shows the first byte in the lookahead buffer after the match.

Output: Presents the output in the format (B,L)C, where (B,L) is the pointer (P) to the match. This gives the following instructions to the decoder: Go back B bytes in the window and copy L bytes to the output. C is the explicit byte.

Note One or more pointers might be included before the explicit byte that is shown in the Byte column. That is, a metadata pointer does not always need to be followed by an explicit byte. An input stream of "ABCABCCCC", for example, can be represented as "(0,0)A(0,0)B(0,0)C(3,3)(1,3)" using the (B,L)C notation, with the last two elements being pointers without explicit bytes. The compressed output can be any combination of pointers and explicit bytes.

Compression process output

Step	Position	Match	Byte	Output
1.	1	--	A	(0,0)A
2.	2	A	--	(1,1)
3.	3	--	B	(0,0)B
4.	4	--	C	(0,0)C
5.	5	B	--	(2,1)
6.	6	B	--	(1,1)
7.	7	A B C	--	(5,3)

The result of compression, conceptually, is the output column—that is, a series of bytes and optional metadata that indicates whether that byte is preceded by some sequence of bytes that is already in the output.

Because representing the metadata itself requires bytes in the output stream, it is inefficient to represent a single byte that has previously been encoded by two bytes of metadata (offset and length). The overhead of the metadata bytes equals or exceeds the cost of outputting the bytes directly. Therefore, the protocol considers sequences of bytes to only be a match if the sequences have three or more bytes in common.

Decompression Process

The decompression algorithm processes the compressed stream from start to end. For each null pointer, it appends the associated byte directly to the end of the output stream. For each non-null pointer, it reads back to the specified offset from the current end of the output stream and appends the specified number of bytes to the end of the output stream.

Decompression Process Example

The input stream for this example is the output of the compression example above.

The following table shows the construction of the output stream as it is built from the sequence of pointers in the input stream. The table includes the following columns:

Step: Indicates the number of the decoding step. A step in the table finishes every time the decoding algorithm appends the set of bytes identified by the pointer to the output stream.

Input Pointer: The next pointer from the input stream.

Append Bytes: The bytes that the pointer identifies to be appended to the output stream.

Output Stream: The output stream as it looks at the end of each step.

Step	Input Pointer	Append Bytes	Output Stream
1.	(0,0)A	A	A
2.	(1,1)	A	A A
3.	(0,0)B	B	A A B
4.	(0,0)C	C	A A B C
5.	(2,1)	B	A A B C B
6.	(1,1)	B	A A B C B B
7.	(5,3)	ABC	A A B C B B A B C

2.1.1.1.2 DIRECT2 Encoding Algorithm

The basic notion of the DIRECT2 Encoding Algorithm is that data appears unchanged in the compressed representation, and metadata is encoded in the same output stream, and in line with the data.

The key to decoding the compressed data is recognizing what bytes are metadata and what bytes are data. The decoder MUST be able to identify the presence of metadata in the compressed and encoded data stream. Bitmasks are inserted periodically in the byte stream to provide this information to the decoder.

This section describes the bitmasks that enable the decoder to distinguish data from metadata. It also describes the process of encoding the metadata.

Bitmask

To distinguish data from metadata in the compressed byte stream, the data stream begins with a 4-byte bitmask that indicates to the decoder whether the next byte to be processed is data (a "0" value in the bit), or if the next byte (or series of bytes) is metadata (a "1" value in the bit). If a "0" bit is encountered, the next byte in the input stream is the next byte in the output stream. If a "1" bit is encountered, the next byte or series of bytes is metadata that **MUST** be interpreted further.

For example, a bitmask of 0x01000000 indicates that the first seven bytes are actual data, followed by encoded metadata that starts at the eighth byte. The metadata is followed by 24 additional bytes of data. A bitmask of 0x11200000 indicates that there will be metadata in the 4th, 8th, and 11th elements (note that it is possible for the actual byte positions in the compressed data to be different because metadata elements range from 2 to 6 bytes in length), with the remaining elements being data bytes.

When the bitmask has been consumed, the next four bytes in the input stream are another bitmask.

The bitmask **MUST** also contain a "1" in the bit following the last encoded element, to indicate the end of the compressed data. For example, given a hypothetical 8-bit bitmask, the string "ABCABCDEF" is compressed as (0,0)A(0,0)B(0,0)C(3,3)D(0,0)E(0,0)F. Its bitmask would be b'00010001' (0x11). This would indicate three bytes of data, followed by metadata, followed by an additional 3 bytes, finally terminated with a "1" to indicate the end of the stream.

The final end bit is always necessary, even if an additional bitmask has to be allocated. If the string in the above example was "ABCABCDEF`G`", for example, it would require an additional bitmask. It would begin with the bitmask b'00010000', followed by the compressed data, and followed by another bitmask with a "1" as the next bit to indicate the end of the stream.

Encoding Metadata

In the output stream, actual data bytes are stored unchanged. Bitmasks are stored periodically to indicate whether the next byte or bytes are data or metadata. If the next bit in the bitmask is a "1", the next set of bytes in the input data stream is metadata (unless the last element of data was read, in which case the "1" bit would indicate the end of the stream as noted above). This metadata contains an offset back to the start of the data to be copied to the output stream, and the length of the data to be copied.

To represent the metadata as efficiently as possible, the encoding of that metadata is not fixed in length. The encoding algorithm supports the largest possible floating compression window to increase the probability of finding a large match; the larger the window, the greater the number of bytes that are needed for the offset. The encoding algorithm also supports the longest possible match; the longer the match length, the greater the number of bytes that are needed to encode the length.

Metadata Offset

The protocol assumes the metadata is two bytes in length. The three low-order bits are used to encode the length. The high-order 13 bits are a first complement of the offset, which is represented as a negative signed value in 2's complement. The offset is only encoded with those 13 bits. This value cannot be extended and defines the maximum size of the compression floating window. For example, the metadata 0x0018 is converted into the offset b'000000000011', and the length b'000'. The offset is '-4', computed by inverting the offset bits, treating the result as a 2's complement, and converting it to an integer.

Match Length

Unlike the metadata offset, the match length is extensible. If the length is less than 10 bytes, it is encoded in the three low-order bits of the 2-byte metadata. Although three bits seems to allow for a

maximum length of six (the value b'111' is reserved), because the minimum match is three bytes, these three bits actually allow for the expression of lengths from three to nine. The match length goes from $L = b'000' + 3$ bytes, to $L = b'110' + 3$ bytes. Because smaller lengths are much more common than the larger lengths, the algorithm tries to optimize for smaller lengths. To encode a length between three and nine, we use the three bits that are "in-line" in the 2-byte metadata.

If the length of the match is greater than nine bytes, an initial bit pattern of b'111' is put in the three bits. This does not signify a length of 10 bytes, but instead a length that is greater than or equal to 10, which is included in the low-order nibble of the following byte.

Every other time that the length is greater than nine, an additional byte follows the initial 2-byte metadata. The first time that the additional byte is included, the low-order nibble is used as the additive length. The high-order nibble is "reserved" for the next metadata instance when the length is greater than nine. Therefore, the first time that the decoder encounters a length that is greater than nine, it reads the next byte from the data stream and the low-order nibble is extracted and used to compute the length for this metadata instance. The high-order nibble is remembered and used the next time that the decoder encounters a metadata length that is greater than nine. The third time that a length that is greater than nine is encountered, another extra byte is added after the 2-byte metadata, with the low-order nibble used for this length and the high-order nibble reserved for the fourth length that is greater than nine, and so on.

If the nibble from this "shared" byte is all "1s" (for example, b'1111'), another byte is added after the shared byte to hold more length. In this manner, a length of 24 is encoded as follows:

- b'111' (in the three bits in the original two bytes of metadata), plus
- b'1110' (in the nibble of the "shared" byte of extended length)
- b'111' means 10 bytes plus b'1110', which is 14, which results in a total of 24.

If the length is more than 24, the next byte is also used in the length calculation. In this manner, a length of 25 is encoded as follows:

- b'111' (in the three bits in the original two bytes of metadata), plus
- b'1111' (in the nibble of the "shared" byte of extended length), plus
- b'00000000' (in the next byte).

This scheme is good for lengths of up to 279 (a length of 10 in the three bits in the original two bytes of metadata, plus a length of 15 in the nibble of the "shared" byte of extended length, plus a length of up to 254 in the extra byte).

A "full" (all b'1') bit pattern (b'111', b'1111', and b'11111111') means that there is more length in the following two bytes.

The final two bytes of length differ from the length information that comes earlier in the metadata. For lengths that are equal to 280 or greater, the length is calculated only from these last two bytes, and is not added to the previous length bits. The value in the last two bytes, a 16-bit integer, is three less than the metadata length. These last two bytes allow for a match length of up to 65,535 bytes + 3 bytes (the minimum match length).

The following table summarizes the length representation in metadata.

Note Length is computed from the bits that are included in the metadata plus the minimum match length of three.

Length representation in metadata

Match length	Length bits in the metadata
24	b'111' (three bits in the original two bytes of metadata) + b'1110' (in the high-order or lower-order nibble, as appropriate, of the shared byte)
25	b'111' (three bits in the original two bytes of metadata) + b'1111' (in the high-order or lower-order nibble, as appropriate, of the shared byte) + b'00000000' (in the next byte)
26	b'111' (three bits in the original two bytes of metadata) + b'1111' (in the high-order or lower-order nibble, as appropriate, of the shared byte) + b'00000001' (in the next byte)
279	b'111' (three bits in the original two bytes of metadata) + b'1111' (in the high-order or lower-order nibble, as appropriate, of the shared byte) + b'11111110' (in the next byte)
280	b'111' (three bits in the original two bytes of metadata) b'1111' (in the high-order or lower-order nibble, as appropriate, of the shared byte) b'11111111' (in the next byte) 0x0115 (in the next two bytes). These two bytes represent a length of 277 + 3 (minimum match length). Note All of the length is included in the final two bytes and is not additive, as were the previous length calculations for lengths that are smaller than 280 bytes.
281	b'111' (three bits in the original two bytes of metadata) b'1111' (in the high-order or lower-order nibble, as appropriate, of the shared byte) b'11111111' (in the next byte) 0x0116 (in the next two bytes). This is 278 + 3 (minimum match length). Note All of the length is included in the final two bytes and is not additive, as were the previous length calculations for lengths that are smaller than 280 bytes.

A "full" bit pattern in that last half word does not mean that more metadata is coming after the last bytes.

The LZ77 Compression Algorithm (section 2.1.1.1.1) produces a well-compressed encoding for small valued lengths, but as the length increases, the encoding becomes less well compressed. A match length of greater than 278 bytes requires a relatively large number of bits: 3+4+8+16. This includes three bits in the original two bytes of metadata, four bits in the nibble in the "shared" byte, eight bits in the next byte, and 16 bits in the final two bytes of metadata.

2.2 Common Message Syntax

This section specifies the syntax of SOAP messages, which are part of this protocol. The following rules apply to all SOAP messages in the protocol.

- The **soap:header** element (as specified in [SOAP1.1] section 4.2 and [SOAP1.2-1/2003] section 5.2) MUST NOT be used.
- The **soap:binding** element of the Web Services Description Language (WSDL) MUST specify style="document", as specified in [WSDL] section 3.3.
- The **soap:body** element of the WSDL MUST specify use="literal", as specified in [WSDL] section 3.5.

For specific WSDL elements, the protocol specifies additional restrictions beyond those specified by the WSDL syntax of the elements<9>. For instance, in some cases, the protocol always requires the presence of an element in a message, even though its WSDL specification has a **minOccurs** attribute set to 0. In other cases, the protocol requires stronger typing on elements than is specified by the WSDL for the elements.

In all such cases, the additional restrictions are specified immediately after the WSDL is given.

2.2.1 Namespaces

The following table shows the standard XML namespaces used within this protocol and the alias (prefix) used in the remaining sections of this specification.

Alias (Prefix)	XML Namespace
http	http://schemas.xmlsoap.org/wsdl/http/ (as specified in [RFC2616])
s	http://www.w3.org/2001/XMLSchema (as specified in [XMLSCHEMA2])
soap	http://schemas.xmlsoap.org/wsdl/soap/ (as specified in [SOAP1.1])
soap12	http://schemas.xmlsoap.org/wsdl/soap12/ (as specified in [SOAP1.2-1/2003] and [SOAP1.2-2/2003])
soapenc	http://schemas.xmlsoap.org/soap/encoding/ (as specified in [SOAP1.1])
wsdl	http://schemas.xmlsoap.org/wsdl/ (as specified in [WSDL])

The Microsoft-defined XML namespaces used in this protocol are listed in the product behavior appendix.<10>

2.2.2 Messages

2.2.2.1 SimpleAuth Web Service

The SimpleAuth Web service is used for restricting availability of updates to groups of clients.

2.2.2.1.1 GetAuthorizationCookie

Synopsis:

This method provides a mechanism for the server to authenticate and authorize client access to the client Web service.

```
<wsdl:operation name="GetAuthorizationCookie" />
```

The SOAP operation is defined as given below.

```
<soap:operation soapAction="http://www.microsoft.com/
SoftwareDistribution/Server/SimpleAuthWebService/GetAuthorizationCookie"
style="document" />
```

Request:

```
<s:element name="GetAuthorizationCookie">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="clientId"
        type="s:string" />
      <s:element minOccurs="0" maxOccurs="1" name="targetGroupName"
        type="s:string" />
      <s:element minOccurs="0" maxOccurs="1" name="dnsName"
        type="s:string" />
    </s:sequence>
  </s:complexType>
</s:element>
```

clientId: A ClientIdString that the client SHOULD generate at the time of installation to identify itself. This element MUST be present.

targetGroupName: A named collection of computers (target group) in which the client claims membership.

dnsName: The client's name. It MUST uniquely identify the computer on the network. The client MUST also use the same value in the call to RegisterComputer (section 2.2.2.2.3). This element MUST be present.

Response:

The server MUST return a result with the following syntax.

```
<s:element minOccurs="0" maxOccurs="1"
  name="GetAuthorizationCookieResult" type="s1:AuthorizationCookie" />
```

GetAuthorizationCookieResult: Upon successful completion of this operation, this element MUST be returned. The syntax for the AuthorizationCookie type MUST be as specified in section 2.2.3.4.

2.2.2.2 Client Web Service

The client Web service is used for synchronizing metadata to the client.

2.2.2.2.1 (Updated Section) GetConfig

Synopsis:

This method returns information on the server's registration, authorization, and reporting requirements.

```
<wsdl:operation name="GetConfig" />
```

The SOAP operation is defined as follows.

```
<soap:operation soapAction="http://www.microsoft.com/
SoftwareDistribution/Server/ClientWebService/GetConfig"
```

```
style="document" />
```

Request:

```
<s:element name="GetConfig">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="protocolVersion"
        type="s:string" />
    </s:sequence>
  </s:complexType>
</s:element>
```

protocolVersion: The client protocol version, as a two-part version string where the two parts are separated by a period. The client SHOULD pass "1.8".<11>

Response: The server MUST return a result with the following syntax.

```
<s:element name="GetConfigResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="GetConfigResult"
        type="s1:Config" />
    </s:sequence>
  </s:complexType>
</s:element>
```

GetConfigResult: On successful completion of this operation, this element MUST be returned. The syntax of the GetConfigResult type MUST be as follows.

```
<s:complexType name="Config">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="LastChange"
      type="s:dateTime" />
    <s:element minOccurs="1" maxOccurs="1" name="IsRegistrationRequired"
      type="s:boolean" />
    <s:element minOccurs="0" maxOccurs="1" name="AuthInfo"
      type="s1:ArrayOfAuthPlugInInfo" />
    <s:element minOccurs="0" maxOccurs="1" name="AllowedEventIds"
      type="s1:ArrayOfInt" />
    <s:element minOccurs="0" maxOccurs="1" name="Properties"
      type="s1:ArrayOfConfigurationProperty" />
  </s:sequence>
</s:complexType>
```

LastChange: The last time configuration data changed on the server.

IsRegistrationRequired: Specifies whether the server requires registration (as specified in section 2.2.2.2.3). Set TRUE to indicate registration is required. Set FALSE to indicate that registration is not required.

AuthInfo: Contains an array of authorization plug-ins supported by the server. On successful execution of this operation, this array MUST contain exactly one element. Its format (ArrayOfAuthPlugInInfo) is as follows.

```
<s:complexType name="ArrayOfAuthPlugInInfo">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="AuthPlugInInfo"
      nillable="true" type="s1:AuthPlugInInfo" />
  </s:sequence>
</s:complexType>
```

```

    </s:sequence>
</s:complexType>

```

AuthPlugInInfo: This field MUST be present and MUST contain exactly one element in the array. It provides information about the Authorization PlugIn available on the server. Its format is as follows.

```

<s:complexType name="AuthPlugInInfo">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="PlugInID"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="ServiceUrl"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="Parameter"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

PlugInID: This MUST be present and MUST have the value "SimpleTargeting".

ServiceUrl: This MUST be set to the URL of the SimpleAuth Web service. It is a partial URL that can be appended to http://<server>:<server port>/ to form the full URL to be used for SimpleAuth Web service. The client MUST only use this web service URL to make GetAuthorizationCookie calls.

Parameter: Unused. It MUST NOT be present and MUST be ignored upon receipt.

AllowedEventIds: Contains an array of event identifiers specifying events required by the reporting Web service of the server.

Properties: A set of properties used in the protocol. Its format (~~ArrayOfConfigurationProperties~~ ~~ArrayOfConfigurationProperty~~) is in the following example. A ConfigurationProperty with Name set to "MaxExtendedUpdatesPerRequest" MUST be present. The other listed ~~ConfigurationProperties~~ ~~ConfigurationProperty properties~~ SHOULD be present in server protocol version 3.0 or higher, but MUST NOT be present in prior versions.

```

<s:complexType name="ArrayOfConfigurationProperty">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded"
      name="ConfigurationProperty" nillable="true"
      type="s1:ConfigurationProperty" />
  </s:sequence>
</s:complexType>

```

ConfigurationProperty: Its format is as follows.

```

<s:complexType name="ConfigurationProperty">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="Name"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="Value"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

Name	Value
MaxExtendedUpdatesPerRequest	This element specifies the maximum number of revisionIDs that the server allows the client to specify in the

Name	Value
	GetExtendedUpdateInfo (section 2.2.2.2.6) method.
PackageServerShare	This element is a UncPath that specifies the repair path.
ProtocolVersion	This element specifies the server protocol version number that this protocol server is using. It SHOULD be "3.2".<12>
IsInventoryRequired	The value MUST be "0".
ClientReportingLevel	The value SHOULD be "2".

2.2.2.2.2 GetCookie

Synopsis:

A client invokes this method to obtain or renew a cookie containing opaque implementation-specific authorization, authentication, and state information for use by the server.

```
<wsdl:operation name="GetCookie" />
```

The SOAP operation is defined as follows.

```
<soap:operation soapAction="http://www.microsoft.com/
SoftwareDistribution/Server/ClientWebService/GetCookie"
style="document" />
```

Request:

```
<s:element name="GetCookie">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="authCookies"
        type="s1:ArrayOfAuthorizationCookie" />
      <s:element minOccurs="0" maxOccurs="1" name="oldCookie"
        type="s1:Cookie" />
      <s:element minOccurs="1" maxOccurs="1" name="lastChange"
        type="s:dateTime" />
      <s:element minOccurs="1" maxOccurs="1" name="currentTime"
        type="s:dateTime" />
      <s:element minOccurs="0" maxOccurs="1" name="protocolVersion"
        type="s:string" />
    </s:sequence>
  </s:complexType>
</s:element>
```

authCookies: Specifies an array of authorization cookies. Its format (ArrayOfAuthorizationCookie) is in the following example. Upon successful completion of this operation, this element MUST be present and MUST contain exactly one AuthorizationCookie (section 2.2.3.4).

```
<s:complexType name="ArrayOfAuthorizationCookie">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded"
      name="AuthorizationCookie" nillable="true"
      type="s1:AuthorizationCookie" />
  </s:sequence>
```

```
</s:complexType>
```

AuthorizationCookie: Authorization cookie MUST be as specified in section 2.2.3.4.

oldCookie: Optionally specifies an existing cookie (that MUST have been obtained from a previous method call to `GetCookie`, `GetFileLocations` (section 2.2.2.2.7), or `SyncUpdates` (section 2.2.2.2.4)) that needs renewal by the server.

lastChange: Specifies the value returned from the client's most recent call to the `GetConfig` (section 2.2.2.2.1) method.

currentTime: The current time on the client.

protocolVersion: The client protocol version, as a two-part version string where the two parts are separated by a period. The client SHOULD pass "1.8".

Response: The server MUST return a result with the following syntax.

```
<s:element name="GetCookieResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="GetCookieResult"
        type="s1:Cookie" />
    </s:sequence>
  </s:complexType>
</s:element>
```

GetCookieResult: On successful completion of this operation, this element MUST be returned. The format for this element MUST be as specified in section 2.2.3.5.

2.2.2.2.3 RegisterComputer

Synopsis:

The client invokes this method to perform registration with the server by providing information about its operating system, hardware, and network parameter configuration.

```
<wsdl:operation name="RegisterComputer" />
```

The SOAP operation is defined as follows.

```
<soap:operation soapAction="http://www.microsoft.com/
  SoftwareDistribution/Server/ClientWebService/RegisterComputer"
  style="document" />
```

Request:

```
<s:element name="RegisterComputer">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="cookie"
        type="s1:Cookie" />
      <s:element minOccurs="0" maxOccurs="1" name="computerInfo"
        type="s1:ComputerInfo" />
    </s:sequence>
  </s:complexType>
</s:element>
```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

computerInfo: Information about the client computer (2). Its format is as follows.

```
<s:complexType name="ComputerInfo"> <s:sequence>
  <s:element minOccurs="0" maxOccurs="1" name="DnsName"
    type="s:string" />
  <s:element minOccurs="1" maxOccurs="1" name="OSMajorVersion"
    type="s:int" />
  <s:element minOccurs="1" maxOccurs="1" name="OSMinorVersion"
    type="s:int" />
  <s:element minOccurs="1" maxOccurs="1" name="OSBuildNumber"
    type="s:int" />
  <s:element minOccurs="1" maxOccurs="1" name="OSServicePackMajorNumber"
    type="s:short" />
  <s:element minOccurs="1" maxOccurs="1" name="OSServicePackMinorNumber"
    type="s:short" />
  <s:element minOccurs="0" maxOccurs="1" name="OSLocale"
    type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="ComputerManufacturer"
    type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="ComputerModel"
    type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="BiosVersion"
    type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="BiosName"
    type="s:string" />
  <s:element minOccurs="1" maxOccurs="1" name="BiosReleaseDate"
    type="s:dateTime" />
  <s:element minOccurs="0" maxOccurs="1" name="ProcessorArchitecture"
    type="s:string" />
  <s:element minOccurs="1" maxOccurs="1" name="SuiteMask"
    type="s:short" />
  <s:element minOccurs="1" maxOccurs="1" name="OldProductType"
    type="s:unsignedByte" />
  <s:element minOccurs="1" maxOccurs="1" name="NewProductType"
    type="s:int" />
  <s:element minOccurs="1" maxOccurs="1" name="SystemMetrics"
    type="s:int" />
  <s:element minOccurs="1" maxOccurs="1" name="ClientVersionMajorNumber"
    type="s:short" />
  <s:element minOccurs="1" maxOccurs="1" name="ClientVersionMinorNumber"
    type="s:short" />
  <s:element minOccurs="1" maxOccurs="1" name="ClientVersionBuildNumber"
    type="s:short" />
  <s:element minOccurs="1" maxOccurs="1" name="ClientVersionQfeNumber"
    type="s:short" />
  <s:element minOccurs="0" maxOccurs="1" name="OSDescription" type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="OEM" type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="DeviceType" type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="FirmwareVersion" type="s:string" />
  <s:element minOccurs="0" maxOccurs="1" name="MobileOperator" type="s:string" />
</s:sequence>
</s:complexType>
```

DnsName: The client's name. It MUST uniquely identify the computer on the network. The client MUST also use the same value in the call to GetAuthorizationCookie (section 2.2.2.1.1). This element MUST be present.

OSMajorVersion: The client operating system major version number.

OSMinorVersion: The client operating system minor version number.

OSBuildNumber: The client operating system build number.

OSServicePackMajorNumber: The client operating system service pack major number.

OSServicePackMinorNumber: The client operating system service pack minor number.

OSLocale: The client operating system locale, as specified in [MS-LCID].

ComputerManufacturer: The manufacturer of the client computer.

ComputerModel: The model of the client computer.

BiosVersion: The version of the client computer's BIOS firmware.

BiosName: The name of the client computer's BIOS firmware.

BiosReleaseDate: The release date of the client computer's BIOS firmware.

ProcessorArchitecture: The architecture of the client computer's CPU. Unlike the ProcessorArchitecture element used in the **ReportEventBatch** method (described in section 2.2.2.3.1), the ProcessorArchitecture element of the **RegisterComputer** method is not an enumeration; there is no predefined set of values, and a given client need not use the same value for ProcessorArchitecture in the **ReportEventBatch** method that it uses for the **RegisterComputer** method.

SuiteMask, OldProductType, NewProductType, SystemMetrics: Operating system properties that help the server identify the name of the client's operating system. These elements SHOULD<13> be present.

ClientVersionMajorNumber: The Windows Update Agent (WUA) major version number. This is the first part in the four-part WUA version string. This element SHOULD be present.

ClientVersionMinorNumber: The WUA minor version number. This is the second part in the four-part WUA version string. This element SHOULD be present.

ClientVersionBuildNumber: The WUA build number. This is the third part in the four-part WUA version string. This element SHOULD be present.

ClientVersionQfeNumber: The WUA QFE number. This is the fourth part in the four-part WUA version string. This element SHOULD be present.

The following elements SHOULD<14> be present.

OSDescription: The commercial name of the operating system including the edition.

OEM: The original equipment manufacturer of the client device.

DeviceType: The model of the client device.

FirmwareVersion: The firmware version of the client device; for example 2040.0021.12522.211.

MobileOperator: For devices with mobile SKUs only. This is the current mobile operator of the device. The field is in form xxx-yy where xxx is the alphanumeric mobile operator ID and yy is the country code. For example: 000-88 (World-wide Open Market), or VZW-US (Verizon Wireless).

Response:

```
<s:element name="RegisterComputerResponse">
  <s:complexType />
</s:element>
```

This type has no fields.

2.2.2.2.4 (Updated Section) SyncUpdates

Synopsis:

This method is invoked to perform synchronization of metadata describing software update content. The syntax of this method refers to the following concepts as specified in sections 3.1.1 and 3.2.1.

- The integer-valued revision ID used to identify an update revision.
- The string-valued HardwareID, which identifies a hardware device installed on the client machine.
- The integer-valued deployment ID, which identifies a deployment.
- The prerequisite relationship between updates.
- The client metadata cache.

```
<wsdl:operation name="SyncUpdates" />
```

The SOAP operation is defined as follows.

```
<soap:operation soapAction="http://www.microsoft.com/  
SoftwareDistribution/Server/ClientWebService/SyncUpdates"  
style="document" />
```

Request:

```
<s:element name="SyncUpdates">  
  <s:complexType>  
    <s:sequence>  
      <s:element minOccurs="0" maxOccurs="1" name="cookie"  
        type="s1:Cookie" />  
      <s:element minOccurs="0" maxOccurs="1" name="parameters"  
        type="s1:SyncUpdateParameters" />  
    </s:sequence>  
  </s:complexType>  
</s:element>
```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates. This element MUST be present.

Parameters: Additional parameters to this method. This element MUST be present. Its format is as follows.<15>

```
<s:complexType name="SyncUpdateParameters">  
  <s:sequence>  
    <s:element minOccurs="1" maxOccurs="1" name="ExpressQuery" type="s:boolean" />  
    <s:element minOccurs="0" maxOccurs="1" name="InstalledNonLeafUpdateIDs"  
      type="s1:ArrayOfInt" />  
    <s:element minOccurs="0" maxOccurs="1" name="OtherCachedUpdateIDs"  
      type="s1:ArrayOfInt" />  
    <s:element minOccurs="0" maxOccurs="1" name="SystemSpec" type="s1:ArrayOfDevice" />  
    <s:element minOccurs="0" maxOccurs="1" name="CachedDriverIDs"  
      type="s1:ArrayOfInt" />  
    <s:element minOccurs="1" maxOccurs="1" name="SkipSoftwareSync" type="s:boolean" />  
    <s:element minOccurs="0" maxOccurs="1" name="FilterCategoryIds"  
      type="s1:ArrayOfCategoryIdentifier" />  
    <s:element minOccurs="0" maxOccurs="1" name="NeedTwoGroupOutOfScopeUpdates"  
      type="s:boolean" />
```

```

    <s:element minOccurs="0" maxOccurs="1" name="ComputerSpec"
      type="s1:ComputerHardwareSpecification" />
    <s:element minOccurs="0" maxOccurs="1" name="FeatureScoreMatchingKey"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

ExpressQuery: This parameter MUST be absent or set to FALSE by the client. It MUST be ignored by the update server.

InstalledNonLeafUpdateIDs: Contains an array of revision IDs of all non-leaf (in the prerequisite graph) revisions in the client cache that are installed on the client. These IDs MUST have been obtained from the UpdateInfo.ID returned from previous calls to this method.

OtherCachedUpdateIDs: Contains an array of revision IDs of other revisions in the client cache. These IDs MUST have been obtained from the UpdateInfo.ID returned from previous calls to this method.

SystemSpec: Specifies the client's existing hardware devices and installed drivers. This information is used in the driver synchronization query to determine if a more closely-matching driver is available on the server. Its format (ArrayOfDevice) is as follows:

```

<s:complexType name="ArrayOfDevice">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="Device"
      nillable="true" type="s1:Device" />
  </s:sequence>
</s:complexType>

```

Device: The SystemSpec is an array of devices. Its format is as follows:

```

<s:complexType name="Device">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="HardwareIDs"
      type="s1:ArrayOfString" />
    <s:element minOccurs="0" maxOccurs="1" name="CompatibleIDs"
      type="s1:ArrayOfString" />
    <s:element minOccurs="0" maxOccurs="1" name="installedDriver"
      type="s1:InstalledDriver" />
    <s:element minOccurs="0" maxOccurs="1" name="extensionDrivers"
      type="s1:ArrayOfExtensionDriver" />
    <s:element minOccurs="0" maxOccurs="1" name="DriverRecoveryIDs"
      type="s1:ArrayOfDriverRecoveryID" />
  </s:sequence>
</s:complexType>

```

HardwareIDs: An array of HardwareID values that identify the devices hardware supported by this driver.

CompatibleIDs: An array of HardwareID values that identify the compatible hardware for this device driver.

installedDriver: If a driver is already installed for this device, this describes properties of that driver. Its format is as follows: <16>

```

<s:complexType name="InstalledDriver">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="MatchingID"
      type="s:string" />
    <s:element minOccurs="1" maxOccurs="1" name="DriverVerDate"

```

```

        type="s:dateTime" />
<s:element minOccurs="1" maxOccurs="1" name="DriverVerVersion"
  type="s:long" />
<s:element minOccurs="0" maxOccurs="1" name="Class" type="s:string" />
<s:element minOccurs="0" maxOccurs="1" name="Manufacturer"
  type="s:string" />
<s:element minOccurs="0" maxOccurs="1" name="Provider"
  type="s:string" />
<s:element minOccurs="0" maxOccurs="1" name="Model"
  type="s:string" />
<s:element minOccurs="0" maxOccurs="1" name="MatchingComputerHWID" nillable="true"
  type="s2:guid" />
<s:element minOccurs="1" maxOccurs="1" name="DriverRank" type="s:int" />
</s:sequence>
</s:complexType>

```

- **MatchingID:** The HardwareID or compatibleID corresponding to the installed driver.
- **DriverVerDate:** The release date of the driver.
- **DriverVerVersion:** The software version of the driver.
- **Class:** The driver class (for example, Printer, Display, and so on), as specified by the driver during installation (typically in the driver INF file).
- **Manufacturer:** The company that created the driver.
- **Provider:** The company providing the driver.
- **Model:** The hardware model that the driver targets.
- **MatchingComputerHWID:** The computer HardwareId to which the driver matches.
- **DriverRank:** The rank of the driver against a device.

extensionDrivers: Extensions of a base driver. A base driver MAY have 0 or more associated extension drivers.<17>

```

<s:complexType name="extensionDrivers">
  <s:sequence>
    <s:element name="ExtensionId" type="s:string" minOccurs="1" maxOccurs="1" />
    <s:element name="DriverVerDate" type="s:dateTime" minOccurs="1" maxOccurs="1" />
    <s:element name="DriverVerVersion" type="s:long" minOccurs="1" maxOccurs="1" />
    <s:element name="Class" type="s:string" minOccurs="1" maxOccurs="1" />
  </s:sequence>
</s:complexType>

```

- **ExtensionId:** Specifies the GUID identifier for the extension driver.
- **DriverVerDate:** The release date of the extension driver.
- **DriverVerVersion:** The software version of the extension driver.
- **Class:** The driver class (for example, Printer, Display, and so on), as specified by the driver during installation (typically in the driver INF file).

ArrayOfDriverRecoveryID: An optional array of driver IDs that allow the service to deploy a driver to be uninstalled (set the revision Action to Uninstall) only for drivers originally installed by the WUA agent.

```

<s:complexType name="ArrayOfDriverRecoveryID">
  <s:sequence>

```

```
<s:element minOccurs="0" maxOccurs="unbounded" name="DriverRecoveryID" nillable="true"
type="s:string" />
</s:sequence>
</s:complexType>
```

DriverRecoveryID: A string that indicates that the driver originated from WU. The WUA agent maintains a record of each driver it installs, so that it can be passed up to the server. The format of the string is the update ID of the driver that was installed. The WUA agent SHOULD omit this field for drivers that were installed via other mechanisms<18>.

CachedDriverIDs: The revision IDs of all driver revisions in the client cache. These IDs MUST have been obtained from the UpdateInfo.ID returned from previous calls to this method.

SkipSoftwareSync: Specifies if this request is for a software or driver metadata sync.

FilterCategoryIds: Specifies the list of categories to which the server limits the synchronization. The client MUST NOT send this parameter unless it has specified a protocolVersion greater than or equal to 1.7 during the GetCookie request (section 2.2.2.2.2) and the server specified a ProtocolVersion greater than or equal to 3.2 in the Properties returned in the response to the GetConfig method call (section 2.2.2.2.1). If the client is performing a category scan (as discussed in section 2.2.2.2.8), then the category identifiers in this list MUST be obtained from the response to a call to the StartCategoryScan method (section 2.2.2.2.8). If the client is not performing a category scan, then this list MUST be empty. If this parameter is specified and is not empty, the server MUST return only updates that are related to these categories. Its format is as follows:

```
<s:complexType name="ArrayOfCategoryIdentifier">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="CategoryIdentifier"
      nillable="true" type="s1:CategoryIdentifier" />
  </s:sequence>
</s:complexType>
```

CategoryIdentifier: A GUID identifying a category:

```
<s:complexType name="CategoryIdentifier">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="Id" type="s2:guid" />
  </s:sequence>
</s:complexType>
```

NeedTwoGroupOutOfScopeUpdates: Specifies that the client requires the server to return two sets of out-of-scope updates in the response (documented in the response below). The client MUST NOT send this parameter unless it has specified a protocolVersion greater than or equal to 1.7 during the GetCookie request (section 2.2.2.2.2) and the server specified a ProtocolVersion greater than or equal to 3.2 in the Properties returned in the response to the GetConfig method call (section 2.2.2.2.1).

ComputerSpec: Specifies HardwareIDs for a computer. The HardwareID of a computer contains a list of GUIDs as defined here.

```
<s:complexType name="ComputerHardwareSpecification">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="HardwareIDs" type="s1:ArrayOfGuid" />
  </s:sequence>
</s:complexType>
```

FeatureScoreMatchingKey: Each driver package can have different feature scores corresponding to processor architecture and OS version. The key has the format of "Architecture.OSMajorVersion.OSMinorVersion" (for example "AMD64.10.0"), so the service can select the correct feature score from driver packages and decide the best match.

Response:

```
<s:element name="SyncUpdatesResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="SyncUpdatesResult"
        type="s1:SyncInfo" />
    </s:sequence>
  </s:complexType>
</s:element>
```

SyncUpdatesResult: Upon successful completion of this operation, this element **MUST** be returned. The client **SHOULD** interpret this result, as specified in section 3.1.5.7. Its format is as follows.

```
<s:complexType name="SyncInfo">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="NewUpdates"
      type="s1:ArrayOfUpdateInfo" />
    <s:element minOccurs="0" maxOccurs="1" name="OutOfScopeRevisionIDs"
      type="s1:ArrayOfInt" />
    <s:element minOccurs="0" maxOccurs="1" name="ChangedUpdates"
      type="s1:ArrayOfUpdateInfo" />
    <s:element minOccurs="1" maxOccurs="1" name="Truncated" type="s:boolean" />
    <s:element minOccurs="0" maxOccurs="1" name="NewCookie" type="s1:Cookie" />
    <s:element minOccurs="0" maxOccurs="1" name="DeployedOutOfScopeRevisionIds"
      type="s1:ArrayOfInt" />
    <s:element minOccurs="0" maxOccurs="1" name="DriverSyncNotNeeded" type="s:string" />
  </s:sequence>
</s:complexType>
```

NewUpdates: An array of revisions to be added to the client cache. Its format is as follows.

```
<s:complexType name="ArrayOfUpdateInfo">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="UpdateInfo"
      nillable="true" type="s1:UpdateInfo" />
  </s:sequence>
</s:complexType>
```

UpdateInfo: Information about an update revision. Its format is as follows.

```
<s:complexType name="UpdateInfo">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="ID" type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="Deployment"
      type="s1:Deployment" />
    <s:element minOccurs="1" maxOccurs="1" name="IsLeaf"
      type="s:boolean" />
    <s:element minOccurs="0" maxOccurs="1" name="Xml"
      type="s:string" />
  </s:sequence>
</s:complexType>
```

ID: Specifies the revision ID of this update revision. This ID will be passed as Parameters.InstalledNonLeafUpdateIDs, Parameters.OtherCachedUpdateIDs, or Parameters.CachedDriverIDs in subsequent calls to this method.

Deployment: Information about how this revision was deployed to this client. Its format **MUST** be as follows.

```
<s:complexType name="Deployment">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="ID" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="Action"
      type="s1:DeploymentAction" />
    <s:element minOccurs="0" maxOccurs="1" name="Deadline"
      type="s:string" />
    <s:element minOccurs="1" maxOccurs="1" name="IsAssigned"
      type="s:boolean" />
    <s:element minOccurs="1" maxOccurs="1" name="LastChangeTime"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="DownloadPriority"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="HardwareIds"
      type="s1:ArrayOfString" />
    <s:element minOccurs="0" maxOccurs="1" name="AutoSelect"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="AutoDownload"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="SupersedenceBehavior"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="FlagBitmask"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="ClientBehaviors"
      type="tns:ArrayOfClientBehavior" />
  </s:sequence>
</s:complexType>
```

ID: The server-assigned ID for this deployment.

Action: The action the client performs on this revision: **OptionalInstall**, Install, Uninstall, PreDeploymentCheck (which means do not offer the update, just report back on the status), Block (which means that the update **MUST NOT** be deployed, and is used to override another deployment), Evaluate (which means do not offer the update and do not report back on the status), or Bundle (which means that the update is not be offered for install—it is only deployed because it is bundled by some other explicitly deployed update). **Revisions whose assigned Action is OptionalInstall SHOULD NOT be downloaded and installed automatically by the WUA agent, but are expected to be available to end users for explicit approval.** For revisions whose assigned Action is Block, the server **SHOULD** send the revision to the client with an Action value of PreDeploymentCheck. Alternately, the server **MAY** refrain from sending the revision to the client at all.

The enumeration (DeploymentAction) for this element is as follows:

```
<s:simpleType name="DeploymentAction">
  <s:restriction base="s:string">
    <s:enumeration value="OptionalInstall" />
    <s:enumeration value="Install" />
    <s:enumeration value="Uninstall" />
    <s:enumeration value="PreDeploymentCheck" />
    <s:enumeration value="Block" />
    <s:enumeration value="Evaluate" />
    <s:enumeration value="Bundle" />
  </s:restriction>
</s:simpleType>
```

Deadline: Optionally specifies the time by which the deployment action SHOULD occur, in the syntax specified for s:dateTime (as specified in [XMLSCHEMA2] section 3.2.7). This field MAY be omitted if there is no deadline.

IsAssigned: If set to TRUE, the revision SHOULD be installed automatically by the client. If set to FALSE, the revision SHOULD be offered to users of the client computer (2) but not automatically installed.

LastChangeTime: Specifies when the deployment was created, in the syntax specified for s:date (as specified in [XMLSCHEMA2] section 3.2.9). This element MUST be present.

DownloadPriority: Specifies a value indicating how the client SHOULD prioritize its downloads of content for this update relative to other updates.

HardwareIds: An optional array of HardwareId values that identify the device hardware supported by this update revision. This SHOULD be present when the deployment is of a device driver and when the protocolVersion reported by the client in the GetCookie call is "1.6" or higher.<21>

AutoSelect: The server MUST NOT send this field if the client protocol version is less than 1.8. If this field is sent, it MUST be set to 0.

AutoDownload: The server MUST NOT send this field if the client protocol version is less than 1.8. If this field is sent, it MUST be set to 0.

SupersedenceBehavior: The server MUST NOT send this field if the client protocol version is less than 1.8. If this field is sent, it MUST be set to 0.

FlagBitmask: The server MUST NOT send this field if the client protocol version is less than 1.8. If this field is sent, it MUST be set to 0.

ClientBehaviors: An optional array of ClientBehavior values that identify the metadata a publisher intended for the client.

```
<s:complexType name="ArrayOfClientBehavior">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="ClientMetadata"
      nillable="true" type="tns:ClientMetadata" />
  </s:sequence>
</s:complexType>
```

IsLeaf: Specifies whether this revision is a leaf in the prerequisite graph.

Xml: The core metadata associated with this revision. The server MUST populate this with metadata. These fragments are created as specified in section 3.1.1. The format of the fragment is opaque to the server.

OutOfScopeRevisionIDs: An array of RevisionIDs that identify revisions to be removed from the client cache. If the client is performing a category scan by specifying a list of FilterCategoryIds and by specifying True for NeedTwoGroupOutOfScopeUpdates in the request, this list shall contain only updates that are no longer deployed by the server.

ChangedUpdates: Changes that SHOULD be applied to the deployment or IsLeaf status for revisions in the client cache.

Truncated: Specifies that the server has truncated the set of new revisions returned. If the results have been truncated, it MUST be set to TRUE to indicate that the client SHOULD call this method again. If the results have not been truncated, it MUST be set to FALSE to indicate that the results have not been truncated, so the client SHOULD only call this method again if the method returns a new UpdateInfo with IsLeaf = FALSE.

NewCookie: An updated cookie that the client SHOULD use in subsequent calls.

DeployedOutOfScopeRevisionIds: A list of updates that are still deployed by the server but that are no longer in scope for the current synchronization. The server MUST NOT return this parameter unless it specified a ProtocolVersion of greater than or equal to 3.2 in the Properties returned in the response to the GetConfig method call (section 2.2.2.2.1) and the client specified that it supports a protocolVersion greater than or equal to 1.7 in the GetCookie request (section 2.2.2.2.2), and only if the client specified True for the *NeedTwoGroupOutOfScopeUpdates* parameter in the SyncUpdates request.

DriverSyncNotNeeded: Specifies that there are no drivers in scope for the current synchronization and so it is not necessary for the client to perform a driver sync pass. The server MUST NOT return this parameter unless it specified a ProtocolVersion of greater than or equal to 3.2 in the Properties returned in the response to the GetConfig method call (section 2.2.2.2.1) and if the client specified that it supports a protocolVersion greater than or equal to 1.7 in the GetCookie request (section 2.2.2.2.2).

2.2.2.2.5 RefreshCache

Synopsis:

This method is invoked by the client to update its cache of mappings between compact RevisionIDs and globally unique update identifiers. The difference between these two types of identifiers is specified in section 3.1.1.

```
<wsdl:operation name="RefreshCache" />
<soap:operation soapAction="http://www.microsoft.com/
  SoftwareDistribution/Server/ClientWebService/RefreshCache"
  style="document" />
```

Request:

```
<s:element name="RefreshCache">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="cookie"
        type="s1:Cookie" />
      <s:element minOccurs="0" maxOccurs="1" name="globalIDs"
        type="s1:ArrayOfUpdateIdentity" />
    </s:sequence>
  </s:complexType>
</s:element>
```

cookie: Specifies a cookie that was obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

globalIDs: An array of **UpdateIdentity** elements. Its format MUST be as follows.

```
<s:complexType name="ArrayOfUpdateIdentity">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="UpdateIdentity"
      nillable="true" type="s1:UpdateIdentity" />
  </s:sequence>
</s:complexType>
```

UpdateIdentity: Identifies an update revision. Its format is specified in section 2.2.3.6:

Response:

```
<s:element name="RefreshCacheResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="RefreshCacheResult"
        type="s1:ArrayOfRefreshCacheResult" />
    </s:sequence>
  </s:complexType>
</s:element>
```

RefreshCacheResult: Upon successful completion of this operation, this element MUST be returned. Its format is as follows.

```
<s:complexType name="ArrayOfRefreshCacheResult">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="RefreshCacheResult"
      nillable="true" type="s1:RefreshCacheResult" />
  </s:sequence>
</s:complexType>
```

RefreshCacheResult: Specifies information about a specific revision. Its format is as follows.

```
<s:complexType name="RefreshCacheResult">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="RevisionID"
      type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="GlobalID"
      type="s1:UpdateIdentity" />
    <s:element minOccurs="1" maxOccurs="1" name="IsLeaf"
      type="s:boolean" />
    <s:element minOccurs="0" maxOccurs="1" name="Deployment"
      type="s1:Deployment" />
  </s:sequence>
</s:complexType>
```

RevisionID: Specifies the new 32-bit integer ID for the revision.

GlobalID: The UpdateIdentity for this revision. This field MUST be present. Its format is specified in section 2.2.3.6.

IsLeaf: Specifies whether the revision is a leaf of a hierarchy of updates.

Deployment: The deployment for this revision. This field MUST be present. Its format is specified in section 2.2.2.2.4.

Each of the above values is specified in more detail in section 3.1.1.

2.2.2.2.6 (Updated Section) GetExtendedUpdateInfo

Synopsis:

This method is invoked to obtain detailed metadata for an update.

As specified in section 1.3, the client does not download all the metadata at once during the call to SyncUpdates (section 2.2.2.2.4). Rather, the metadata is divided into fragments, and only the "core" fragment, which contains just enough metadata to allow the client to evaluate if the content is needed, is returned to the client. If the client determines the content is needed, it SHOULD then call this method to obtain the additional metadata fragments that it requires.

```
<wsdl:operation name="GetExtendedUpdateInfo" />
```

The SOAP operation is defined as follows.

```
<soap:operation soapAction="http://www.microsoft.com/  
SoftwareDistribution/Server/ClientWebService/GetExtendedUpdateInfo"  
style="document" />
```

Request:

```
<s:element name="GetExtendedUpdateInfo">  
  <s:complexType>  
    <s:sequence>  
      <s:element minOccurs="0" maxOccurs="1" name="cookie"  
        type="s1:Cookie" />  
      <s:element minOccurs="0" maxOccurs="1" name="revisionIDs"  
        type="s1:ArrayOfInt" />  
      <s:element minOccurs="0" maxOccurs="1" name="infoTypes"  
        type="s1:ArrayOfXmlUpdateFragmentType" />  
      <s:element minOccurs="0" maxOccurs="1" name="locales"  
        type="s1:ArrayOfString" />  
    </s:sequence>  
  </s:complexType>  
</s:element>
```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

revisionIDs: Specifies the array of revision IDs for which extended metadata fragments are to be returned.

infoTypes: Specifies the type of metadata fragments to be returned. Its format (ArrayOfXmlUpdateFragmentType) MUST be as follows.

```
<s:complexType name="ArrayOfXmlUpdateFragmentType">  
  <s:sequence>  
    <s:element minOccurs="0" maxOccurs="unbounded"  
      name="XmlUpdateFragmentType" type="s1:XmlUpdateFragmentType" />  
  </s:sequence>  
</s:complexType>
```

XmlUpdateFragmentType: Specifies the type of metadata fragment. Its enumeration is as follows.

```
<s:simpleType name="XmlUpdateFragmentType">  
  <s:restriction base="s:string">  
    <s:enumeration value="Published" />  
    <s:enumeration value="Core" />  
    <s:enumeration value="Extended" />  
    <s:enumeration value="VerificationRule" />  
    <s:enumeration value="LocalizedProperties" />  
    <s:enumeration value="Eula" />  
  </s:restriction>  
</s:simpleType>
```

locales: Optionally specifies the locales for which localizable extended metadata MUST be returned. Localizable metadata are elements such as human-readable strings, which are represented

differently between locales, as specified in [MS-LCID]. **The service SHOULD always return the EN locale extended metadata.**

Response:

```
<s:element name="GetExtendedUpdateInfoResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1"
        name="GetExtendedUpdateInfoResult" type="s1:ExtendedUpdateInfo" />
    </s:sequence>
  </s:complexType>
</s:element>
```

GetExtendedUpdateInfoResult: Upon successful completion of this operation, this element MUST be returned. Its format MUST be follows.

```
<s:complexType name="ExtendedUpdateInfo">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="Updates"
      type="s1:ArrayOfUpdateData" />
    <s:element minOccurs="0" maxOccurs="1" name="FileLocations"
      type="s1:ArrayOfFileLocation" />
    <s:element minOccurs="0" maxOccurs="1" name="OutOfScopeRevisionIDs"
      type="s1:ArrayOfInt" />
  </s:sequence>
</s:complexType>
```

Updates: An array of entries containing the extended metadata requested for each update. Its format (ArrayOfUpdateData) MUST be as follows.

```
<s:complexType name="ArrayOfUpdateData">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="Update"
      nillable="true" type="s1:UpdateData" />
  </s:sequence>
</s:complexType>
```

UpdateData: Specifies the extended metadata for an update. Its format MUST be as follows.

```
<s:complexType name="UpdateData">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="ID" type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="Xml" type="s:string" />
  </s:sequence>
</s:complexType>
```

ID: The revision ID of the revision.

Xml: An extended metadata fragment for this update. This element MUST be present. These fragments are created as specified in section 3.1.1. The format of the fragment is opaque to the server.

FileLocations: An array of locations for the content corresponding to each update. Its format (ArrayOfFileLocation) MUST be as follows.

```
<s:complexType name="ArrayOfFileLocation">
  <s:sequence>
```

```

    <s:element minOccurs="0" maxOccurs="unbounded" name="FileLocation"
      nillable="true" type="s1:FileLocation" />
  </s:sequence>
</s:complexType>

```

FileLocation: Specifies the location of the file. Its format MUST be as follows.

```

<s:complexType name="FileLocation">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="FileDigest"
      type="s:base64Binary" />
    <s:element minOccurs="0" maxOccurs="1" name="Url"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

FileDigest: This field MUST be present. The value MUST be the SHA-1 hash computed over the content of the file. This value is used to retrieve the file's download location using the GetFileLocations (section 2.2.2.2.7) method. In addition, client implementations SHOULD use this value to authenticate the content file when it is downloaded from the server, by calculating the SHA-1 hash of the downloaded file and comparing the calculated hash to the **FileDigest** hash. Files whose hash does not match SHOULD be discarded by the client.

Url: This field MUST be present. It is an HTTP URI from which it MUST be possible to download the file.

OutOfScopeRevisionIDs: Specifies an array of revision IDs that SHOULD be purged from the client's cache because these updates are no longer in-scope for the client.

2.2.2.2.7 GetFileLocations

Synopsis:

Returns the URL where the specified set of files can be found.

```

<wsdl:operation name="GetFileLocations" />

```

The SOAP operation is defined as follows.

```

<soap:operation soapAction="http://www.microsoft.com/
  SoftwareDistribution/Server/ClientWebService/GetFileLocations"
  style="document" />

```

Request:

```

<s:element name="GetFileLocations">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="cookie"
        type="s1:Cookie" />
      <s:element minOccurs="0" maxOccurs="1" name="fileDigests"
        type="s1:ArrayOfBase64Binary" />
    </s:sequence>
  </s:complexType>
</s:element>

```

cookie: Specifies a cookie that was obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

fileDigests: An array of digests for content corresponding to updates. Each digest MUST be specified as a SHA1 hash. The format is specified in section 2.2.3.7.

Response:

```
<s:element name="GetFileLocationsResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="GetFileLocationsResult"
        type="s1:GetFileLocationsResults" />
    </s:sequence>
  </s:complexType>
</s:element>
```

GetFileLocationsResults: Upon successful completion of the operation, this element MUST be returned. Its format is as follows.

```
<s:complexType name="GetFileLocationsResults">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="FileLocations"
      type="s1:ArrayOfFileLocation" />
    <s:element minOccurs="0" maxOccurs="1" name="NewCookie"
      type="s1:Cookie" />
  </s:sequence>
</s:complexType>
```

FileLocations: The file locations for the files. Its format is specified in section 2.2.2.2.6.

NewCookie: A replacement cookie, generated by the server, that SHOULD be provided by the client in subsequent method invocations.

2.2.2.2.8 StartCategoryScan

Synopsis:

A client invokes this method to request from the server a list of preferred categories to use when synchronizing updates via the SyncUpdates method (section 2.2.2.2.4). A category scan allows a client to synchronize a smaller part of the larger update catalog.

```
<wsdl:operation name="StartCategoryScan" />
```

The SOAP operation is defined as follows.

```
<soap:operation
  soapAction="http://www.microsoft.com/SoftwareDistribution/Server/ClientWebService/StartCategoryScan"
  style="document" />
```

Request:

```
<s:element name="StartCategoryScan">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="requestedCategories"
```

```

        type="s1:ArrayOfCategoryRelationship" />
    </s:sequence>
</s:complexType>
</s:element>

```

requestedCategories: Specifies an array of categories that the client will synchronize. Its format (ArrayOfCategoryRelationships) MUST be as follows. A category scan is expressed using disjunctive normal form (DNF) and is composed of one or more groups of ANDed categories that are Ored together. For instance, a given category scan might request (CAT1 AND CAT2) OR CAT3. In this example, the StartCategoryScan request would contain three requested categories. (CAT1 and CAT2) would be specified as belonging to AND group 1 and CAT3 would belong to AND group 2.

```

<s:complexType name="ArrayOfCategoryRelationship">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="CategoryRelationship"
      nillable="true" type="s1:CategoryRelationship" />
  </s:sequence>
</s:complexType>
<s:complexType name="CategoryRelationship">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="IndexOfAndGroup" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="CategoryId" type="s2:guid" />
  </s:sequence>
</s:complexType>

```

CategoryRelationship: A category that the client wishes to synchronize.

IndexOfAndGroup: The AND group to which the specified category belongs.

CategoryId: The GUID of the requested category.

Response: The server MUST return a result with the following syntax.

```

<s:element name="StartCategoryScanResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="preferredCategoryIds"
        type="s1:ArrayOfGuid" />
      <s:element minOccurs="0" maxOccurs="1" name="requestedCategoryIdsInError"
        type="s1:ArrayOfGuid" />
    </s:sequence>
  </s:complexType>
</s:element>

```

StartCategoryScanResponse: On successful completion of this operation, this element MUST be returned.

preferredCategoryIds: The GUID list of categories that the server wants the client to provide when it invokes the SyncUpdates method.

requestedCategoryIdsInError: The GUID list of categories that the server does not recognize.

2.2.2.2.9 SyncPrinterCatalog

This method is invoked to synchronize metadata describing the best matching printer drivers for the client. The syntax of this method refers to the following concepts as specified in sections 3.1.1 and 3.2.1.

- The integer-valued revision ID used to identify an update revision.

- The string-valued HardwareID, which identifies a hardware device installed on the client machine.
- The integer-valued deployment ID, which identifies a deployment.
- The prerequisite relationship between updates.
- The client metadata cache.

```
<wsdl:operation name="SyncPrinterCatalog" />
```

The SOAP operation is defined as follows:

```
<soap:operation soapAction="http://www.microsoft.com/
  SoftwareDistribution/Server/ClientWebService/SyncUpdates"
  style="document" />
```

Request:

```
<s:element name="SyncPrinterCatalog">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="cookie" type="tns:Cookie" />
      <s:element minOccurs="0" maxOccurs="1" name="installedNonLeafUpdateIDs"
        type="tns:ArrayOfInt" />
      <s:element minOccurs="0" maxOccurs="1" name="printerUpdateIDs"
        type="tns:ArrayOfInt" />
    </s:sequence>
  </s:complexType>
</s:element>
```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

InstalledNonLeafUpdateIDs: Contains an array of revision IDs of all nonleaf (in the prerequisite graph) revisions in the client cache that are installed on the client. These IDs MUST have been obtained from the UpdateInfo.ID returned from a previous call to SyncUpdates.

printerUpdateIDs: Contains an array of revision IDs of all printer driver updates in the client cache. These IDs MUST have been obtained from the UpdateInfo.ID returned from a previous call to SyncUpdates.

Response:

```
<s:element name="SyncPrinterCatalogResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="SyncPrinterCatalogResult"
        type="s1:SyncInfo" />
    </s:sequence>
  </s:complexType>
</s:element>
```

SyncPrinterCatalogResult: Upon successful completion of this operation, this element MUST be returned. The client SHOULD interpret this result, as specified in section 3.1.5.7. The format is the same as the one defined in the Response section of 2.2.2.2.4.

2.2.2.2.10 (Updated Section) GetExtendedUpdateInfo2

This method is invoked to obtain additional metadata, such as the file decryption key, for the encrypted files in an update. If the client determines that additional metadata is needed, it SHOULD call this method.

```
<wsdl:operation name="GetExtendedUpdateInfo2" />
```

The SOAP operation is defined as follows.

```
<wsdl:operation name="GetExtendedUpdateInfo2">
  <soap:operation
    soapAction="http://www.microsoft.com/SoftwareDistribution/Server/ClientWebService/GetExtendedUpdateInfo2"
    style="document" />
```

Request:

```
<s:element name="GetExtendedUpdateInfo2">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="cookie" type="tns:Cookie"/>
      <s:element minOccurs="0" maxOccurs="1" name="updateIDs"
        type="tns:ArrayOfUpdateIdentity"/>
      <s:element minOccurs="0" maxOccurs="1" name="infoTypes"
        type="tns:ArrayOfXmlUpdateFragmentType"/>
      <s:element minOccurs="0" maxOccurs="1" name="locales" type="tns:ArrayOfString"/>
    </s:sequence>
  </s:complexType>
</s:element>
```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

updateIDs: Specifies the array of UpdateIDs for which the additional metadata are to be returned.

infoTypes: Specifies the type of metadata fragments to be returned. Its format (ArrayOfXmlUpdateFragmentType) MUST be as follows:

```
<s:complexType name="ArrayOfXmlUpdateFragmentType">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded"
      name="XmlUpdateFragmentType" type="s1:XmlUpdateFragmentType" />
  </s:sequence>
</s:complexType>
```

XmlUpdateFragmentType: Specifies the type of metadata fragment. Its enumeration is as follows:

```
<s:simpleType name="XmlUpdateFragmentType">
  <s:restriction base="s:string">
    <s:enumeration value="Published" />
    <s:enumeration value="Core" />
    <s:enumeration value="Extended" />
    <s:enumeration value="VerificationRule" />
    <s:enumeration value="LocalizedProperties" />
    <s:enumeration value="Eula" />
    <s:enumeration value="FileUrl" />
  </s:restriction>
</s:simpleType>
```

```

    <s:enumeration value="FileDecryption" />
  </s:restriction>
</s:simpleType>

```

locales: Optionally specifies the locales for which localizable extended metadata **MUST** be returned. Localizable metadata are elements such as human-readable strings, which are represented differently between locales, as specified in [MS-LCID].

Response:

```

<s:element name="GetExtendedUpdateInfo2Response">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="0" maxOccurs="1" name="GetExtendedUpdateInfo2Result"
type="s1:ExtendedUpdateInfo2"/>
    </s:sequence>
  </s:complexType>
</s:element>

```

GetExtendedUpdateInfo2Result: Upon successful completion of this operation, this element must be returned. Its format **MUST** be as follows:

```

<s:complexType name="ExtendedUpdateInfo2">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="Updates" type="tns:ArrayOfUpdateData"/>
    <s:element minOccurs="0" maxOccurs="1" name="FileLocations"
type="tns:ArrayOfFileLocation"/>
    <s:element minOccurs="0" maxOccurs="1" name="UpdateReportingSamplingRates"
type="tns:ArrayOfUpdateReportingSampleRate"/>
    <s:element minOccurs="0" maxOccurs="1" name="FileDecryptionData"
type="tns:ArrayOfFileDecryption"/>
    <s:element minOccurs="0" maxOccurs="1" name="FileDecryptionData2"
type="tns:ArrayOfFileDecryption2"/>
  </s:sequence>
</s:complexType>

```

Updates: An array of entries containing the extended metadata requested for each update. Its format (ArrayOfUpdateData) **MUST** be as follows:

```

<s:complexType name="ArrayOfUpdateData">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="Update"
nillable="true" type="s1:UpdateData" />
  </s:sequence>
</s:complexType>

```

UpdateData: Specifies the extended metadata for an update. Its format **MUST** be as follows:

```

<s:complexType name="UpdateData">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="ID" type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="Xml" type="s:string" />
  </s:sequence>
</s:complexType>

```

ID: The revision ID of the revision.

Xml: An extended metadata fragment for this update. This element **MUST** be present. These fragments are created as specified in section 3.1.1. The format of the fragment is opaque to the server.

FileLocations: An array of locations for the content corresponding to each update. Its format (ArrayOfFileLocation) **MUST** be as follows:

```
<s:complexType name="ArrayOfFileLocation">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="FileLocation"
      nillable="true" type="s1:FileLocation" />
  </s:sequence>
</s:complexType>
```

FileLocation: Specifies the location of the file. Its format **MUST** be as follows:

```
<s:complexType name="FileLocation">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="FileDigest"
      type="s:base64Binary" />
    <s:element minOccurs="0" maxOccurs="1" name="Url"
      type="s:string" />
  </s:sequence>
</s:complexType>
```

FileDigest: This field **MUST** be present. The value **MUST** be the SHA-1 hash computed over the content of the file. This value is used to retrieve the file's download location using the GetFileLocations (section 2.2.2.2.7) method. In addition, client implementations **SHOULD** use this value to authenticate the content file when it is downloaded from the server, by calculating the SHA-1 hash **value** of the downloaded file and comparing the calculated hash to the **FileDigest** hash. Files whose hash does not match **SHOULD** be discarded by the client.

Url: This field **MUST** be present. It is an HTTP URI from which it **MUST** be possible to download the file.

UpdateReportingSamplingRates: Currently unused. An array of sampling rates. Its format (ArrayOfUpdateReportingSamplingRates) **MUST** be as follows

```
<s:complexType name="ArrayOfUpdateReportingSampleRate">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="UpdateReportingSampleRate"
      nillable="true" type="tns:UpdateReportingSampleRate"/>
  </s:sequence>
</s:complexType>
<s:complexType name="UpdateReportingSampleRate">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="UpdateId" type="s2:guid"
      xmlns:q2="http://microsoft.com/wsdl/types/" />
    <s:element minOccurs="1" maxOccurs="1" name="SamplingRateForInstall" type="s:int"/>
    <s:element minOccurs="1" maxOccurs="1" name="SamplingRateForDownload" type="s:int"/>
  </s:sequence>
</s:complexType>
```

FileDecryptionData: An array of file decryption data for files in the update. Its format (ArrayOfFileDecryption) **MUST** be as follows:

```
<s:complexType name="ArrayOfFileDecryption">
  <s:sequence>
```

```

    <s:element minOccurs="0" maxOccurs="unbounded" name="FileDecryption" nillable="true"
type="tns:FileDecryption"/>
  </s:sequence>
</s:complexType>
<s:complexType name="FileDecryption">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="FileDigest" type="s:base64Binary"/>
    <s:element minOccurs="0" maxOccurs="1" name="DecryptionKey" type="s:base64Binary"/>
    <s:element minOccurs="0" maxOccurs="1" name="SecurityData"
type="tns:ArrayOfBase64Binary"/>
  </s:sequence>
</s:complexType>

```

FileDecryption: Specifies the decryption data for a file.

DecryptionKey: This field **MUST** be present. The value **MUST** be the decryption key corresponding to the file represented by **FileDigest**, and is used to decrypt the file.

SecurityData: This field **MUST** be present. WSUS **MUST** return an array of size 1 (that is, it contains a single element), and its value **MUST** be the same as the decryption key.

FileDecryptionData2: An array of file decryption data for files in the updates. Its format (ArrayOfFileDecryption2) **MUST** be as follows:

```

<s:complexType name="ArrayOfFileDecryption2">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="FileDecryption2" nillable="true"
type="tns:FileDecryption2"/>
  </s:sequence>
</s:complexType>

```

FileDecryption2: Same as **FileDecryption**.

2.2.2.3 Reporting Web Service

The reporting Web service is used by clients to report selected events that contain information on their update activity.

2.2.2.3.1 ReportEventBatch

Synopsis:

This method is invoked by a client to report the occurrence of one or more software-update-related events.

```

<wsdl:operation name="ReportEventBatch" />

```

The SOAP operation is defined as follows.

```

<soap:operation soapAction="http://www.microsoft.com/
SoftwareDistribution/ReportEventBatch" style="document" />

```

Request:

```

<s:element name="ReportEventBatch">
  <s:complexType>
    <s:sequence>

```

```

    <s:element minOccurs="0" maxOccurs="1" name="cookie"
      type="s1:Cookie" />
    <s:element minOccurs="1" maxOccurs="1" name="clientTime"
      type="s:dateTime" />
    <s:element minOccurs="0" maxOccurs="1" name="eventBatch"
      type="s1:ArrayOfReportingEvent" />
  </s:sequence>
</s:complexType>
</s:element>

```

cookie: Specifies a cookie that MUST have been obtained from a previous call to GetCookie (section 2.2.2.2.2), GetFileLocations (section 2.2.2.2.7), or SyncUpdates (section 2.2.2.2.4). This element MUST be present.

clientTime: The current time (when this method was called) on the client in Coordinated Universal Time (UTC).

eventBatch: An array of ReportingEvents. Its format MUST be as follows.

```

<s:complexType name="ArrayOfReportingEvent">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="ReportingEvent"
      nillable="true" type="s1:ReportingEvent" />
  </s:sequence>
</s:complexType>

```

ReportingEvent: Specifies information of an update-related event. Its format MUST be as follows.

```

<s:complexType name="ReportingEvent">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="BasicData"
      type="s1:BasicData" />
    <s:element minOccurs="0" maxOccurs="1" name="ExtendedData"
      type="s1:ExtendedData" />
    <s:element minOccurs="0" maxOccurs="1" name="PrivateData"
      type="s1:PrivateData" />
  </s:sequence>
</s:complexType>

```

BasicData: Generic data provided for all events. Its format (BasicData) MUST be as follows.

```

<s:complexType name="BasicData">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="TargetID"
      type="s1:ComputerTargetIdentifier" />
    <s:element minOccurs="1" maxOccurs="1" name="SequenceNumber"
      type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="TimeAtTarget"
      type="s:dateTime" />
    <s:element minOccurs="1" maxOccurs="1" name="EventInstanceID"
      type="s2:guid" />
    <s:element minOccurs="1" maxOccurs="1" name="NamespaceID"
      type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="EventID"
      type="s:short" />
    <s:element minOccurs="1" maxOccurs="1" name="SourceID"
      type="s:short" />
    <s:element minOccurs="0" maxOccurs="1" name="UpdateID"
      type="s1:UpdateRevisionIdentifier" />
    <s:element minOccurs="1" maxOccurs="1" name="Win32Hresult"
      type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="AppName"

```

```
        type="s:string" />
    </s:sequence>
</s:complexType>
```

TargetID: The identity of the client computer (same as the *clientID* parameter to GetAuthorizationCookie (section 2.2.2.1.1)). Its format (ComputerTargetIdentifier) MUST be as follows.

```
<s:complexType name="ComputerTargetIdentifier">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="Sid"
      type="s:string" />
  </s:sequence>
</s:complexType>
```

Sid: A ClientIdString that MUST match the string used as the *clientId* parameter to GetAuthorizationCookie (section 2.2.2.1.1).

SequenceNumber: Unused. MUST be set to 0, and MUST be ignored upon receipt.

TimeAtTarget: The time in Coordinated Universal Time (UTC) when the event was recorded by the client.

EventInstanceID: A GUID generated by the client to uniquely identify this occurrence of this event.

NamespaceID: MUST be set to 1 by all clients. The server MAY ignore events with other values.

EventID: This SHOULD be set to a numeric value that identifies the type of the event that occurred on the client. This numeric value SHOULD be one of the EventID numbers specified in the EventID Table in this section.

SourceID: Defines the subcomponent within the client that generated the event.

UpdateID: Optionally specifies the ID of the update related to this occurrence of this event, for events related to a particular update. If the event is not associated with any particular update, it MUST be specified as {00000000-0000-0000-0000-000000000000}. Its format (UpdateRevisionIdentifier) MUST be as given below.

```
<s:complexType name="UpdateRevisionIdentifier">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="UpdateID"
      type="s2:guid" />
    <s:element minOccurs="1" maxOccurs="1" name="RevisionNumber"
      type="s:int" />
  </s:sequence>
</s:complexType>
```

UpdateID: A GUID that uniquely identifies an update.

RevisionNumber: A number that specifies the version of the update identified by this revision.

Win32Hresult: Optionally specifies a Win32 HRESULT code for events that correspond to a failure. Win32 HRESULT codes are specified in [MS-ERREF].

AppName: The name of the application that triggered the client to perform the operation.

ExtendedData: Additional data associated with an event. Its format (ExtendedData) MUST be as given below.

```

<s:complexType name="ExtendedData">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="ReplacementStrings"
      type="s1:ArrayOfString" />
    <s:element minOccurs="0" maxOccurs="1" name="MiscData"
      type="s1:ArrayOfString" />
    <s:element minOccurs="0" maxOccurs="1" name="ComputerBrand"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="ComputerModel"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="BiosRevision"
      type="s:string" />
    <s:element minOccurs="1" maxOccurs="1" name="ProcessorArchitecture"
      type="s1:ProcessorArchitecture" />
    <s:element minOccurs="1" maxOccurs="1" name="OSVersion"
      type="s1:DetailedVersion" />
    <s:element minOccurs="1" maxOccurs="1" name="OSLocaleID"
      type="s:int" />
    <s:element minOccurs="0" maxOccurs="1" name="DeviceID"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

ReplacementStrings: Specifies an array of strings to be used as parameters in expanding parameterized message strings. Parameterized message strings are message strings that contain placeholders into which instance-specific strings are inserted to obtain an expanded message string. Its format **MUST** be as follows.

```

<s:complexType name="ArrayOfString">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="string"
      nillable="true" type="s:string" />
  </s:sequence>
</s:complexType>

```

MiscData: Additional data not covered by the properties listed here. These **MUST** be specified in the form "x=value" where x is called a tag. <25> See the MiscData table below for information on such well-known tags.

ComputerBrand: Client computer manufacturer.

ComputerModel: Client computer model name.

BiosRevision: Client BIOS firmware revision.

ProcessorArchitecture: Client CPU architecture. The value **MUST** be one of those enumerated. Note that this differs from the ProcessorArchitecture element used in the **RegisterComputer** method, described in section 2.2.2.2.3.

```

<s:simpleType name="ProcessorArchitecture">
  <s:restriction base="s:string">
    <s:enumeration value="Unknown" />
    <s:enumeration value="X86Compatible" />
    <s:enumeration value="IA64Compatible" />
    <s:enumeration value="Amd64Compatible" />
  </s:restriction>
</s:simpleType>

```

OSVersion: Client operating system version. Its format (DetailedVersion) **MUST** be as follows.

```

<s:complexType name="DetailedVersion">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="Major" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="Minor" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="Build" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="Revision" type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="ServicePackMajor"
      type="s:int" />
    <s:element minOccurs="1" maxOccurs="1" name="ServicePackMinor"
      type="s:int" />
  </s:sequence>
</s:complexType>

```

The values provided by the client are implementation-specific.<26>

OSLocaleID: The client operating system locale.

DeviceID: An event-dependent string.

- MUST be a zero-length string if the associated update is not a driver. How the client can determine if an update is a driver is specified in section 3.1.1.
- If EventID indicates a download driver success/failure event, MUST be set to "1".
- If EventID indicates a driver install success/failure event, MUST be set to a non-empty string whose format is opaque to the server.
- Else, MUST be a zero-length string.

PrivateData: This field MUST be present and empty, and MUST be ignored upon receipt. Its format (PrivateData) is as follows.

```

<s:complexType name="PrivateData">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="1" name="ComputerDnsName"
      type="s:string" />
    <s:element minOccurs="0" maxOccurs="1" name="UserAccountName"
      type="s:string" />
  </s:sequence>
</s:complexType>

```

ComputerDnsName: This field MUST be a zero-length string.

UserAccountName: This field MUST be a zero-length string.

MiscData Table

This table defines the tags, their descriptions, and the events for which such tags are used by WUA to populate the **MiscData** element within a ReportingEvent.

Friendly Name	Misc Data Tag	Data Type	Description	Associated Event IDs
OSServicePackBuildNumber	A	Int	Client operating system service pack build number.	All events
ByteCount	B	Int	Number of bytes downloaded.	Download success events
RepeatFailFlag	C	Int	Number of times the update has	Install failure

Friendly Name	Misc Data Tag	Data Type	Description	Associated Event IDs
			failed to install in the past.	events
NumberApplicable	D	Int	Number of updates that were explicitly deployable, installable on the client (Needed), and deployed for install.	Detection events
LastError	F	Int	Secondary error code when Win32HResult is not sufficient to diagnose the problem.	Install and download events
ClientVersion	G	Int	Client version.	All events
ClientSamplingValue	J	Int	Random number between 0 and 999 inclusive, chosen once per computer.	All events
BiosName	K	String	Client BIOS name.	All events
BiosReleaseDate	L	DateTime	Client BIOS release date.	All events
EventType	Q	Int	If this is an install or download event, and the update being reported on is a bundle, then 2. Else 1.	All events
TargetClientVersion	S	String	WUA agent version that the agent is self-updating to.	Self-update events<27>
InstallableUpdateIDs	U	List of GUIDs separated by ;	IDs of updates that were deployed for install, uninstall, or scan, that were found to be installable (Needed).	Status events
InstalledUpdateIDs	V	List of GUIDs separated by ;	IDs of updates that were deployed for install, uninstall, or scan, that were found to be installed.	Status events
InstalledPendingRebootIDs	W	List of GUIDs separated by ;	IDs of updates that were deployed for install, uninstall, or scan, that were found to be installed, but require reboot before taking effect.	Status events
FailedUpdateIDs	g	List of GUIDs separated by ;	IDs of updates that were deployed for install, uninstall, or scan, that were found to need installing or uninstalling, but the attempt to download, install, or uninstall the update has failed.	Status events
DownloadedUpdateIDs	h	List of GUIDs separated by ;	IDs of updates that were deployed for install, that were downloaded to the client but not yet installed.	Status events
MSIAction	X	String	A Microsoft Windows Installer (MSI) action that failed.	MSI/MSP install failure events
MSITransactionCode	Y	GUIDs	Unique ID identifying the transaction that the update was part of.	MSI/MSP install failure events
MSIProductCode	Z	GUIDs	Product code of the MSP.	MSI/MSP install

Friendly Name	Misc Data Tag	Data Type	Description	Associated Event IDs
				failure events
MSIErrorRec	f	int	Extended MSI error code.	MSI/MSP install failure events
SelfUpdatePackageName	a	String	The name of the self-update package.	Self-update events
OSProductType	c	Int	Client operating system ProductType. The value provided in the OSProductType tag is implementation-specific. <28>	All events, if client is Windows Vista operating system or later

EventID Table

This table specifies the list of events that WUA reports to a Windows Server Update Services (WSUS) server. The Name column is a friendly name for the event type, EventID is the numeric identifier used in ReportingEvent, and the English message template is the message that could be shown to the end user for this event type. Where a message template is parameterized (%1, %2, and so on), the WSUS server populates the placeholders with content from the **ReplacementStrings** element of the ReportingEvent. The placeholders are specified starting with %1 and are not recursively evaluated. The <ReplacementStrings> array MUST contain the same number of elements as the number of placeholders specified in the parameterized message.

Name	Event ID	Description	Remarks	English message template
Detection Events				
AGENT_DETECTION_FINISHED	147	Detection succeeded.		Agent has finished detecting items.
AGENT_DETECTION_FAILED	148	Detection failed.		Error: Agent failed detecting with reason: %1.
Status Events				
AGENT_STATUS	153	Reports status of all updates to MS-WUSP 2.0.		Reporting client status.
AGENT_STATUS_30	156	Reports status of all updates to MS-WUSP 3.0.	This event is new in version 3.0 of the protocol.	Reporting client status.
Download Events				
AGENT_DOWNLOAD_FAILED	161	Download failed.		Error: Download failed.
AGENT_DOWNLOAD_SUCCEEDED	162	Download succeeded.		Download succeeded.
AGENT_DOWNLOAD_CANCELED	163	Download canceled.		Download canceled.

Name	Event ID	Description	Remarks	English message template
Install Events				
AGENT_INSTALLING_STARTED	181	User-initiated installation started		Installation Started: Windows has started installing the following update: %1
AGENT_INSTALLING_FAILED	182	User-initiated installation failed.		Installation Failure: Windows failed to install the following update with error %1: %2.
AGENT_INSTALLING_SUCCEEDED	183	User-initiated installation succeeded.		Installation Successful: Windows successfully installed the following update: %1.
AGENT_INSTALL_COMPLETE_WITH_REBOOT	184	User-initiated installation succeeded, requires reboot.		Installation successful and restart required for the following update: %1.
AGENT_INSTALL_CANCEL	186	User-initiated installation canceled.		User canceled the installation.
AGENT_INSTALL_KILLED	187	User-initiated installation timed out, was terminated by the WUA.		Installation killed: Installation of the following update is killed by the agent: %2.
AU_SCHEDULED_INSTALL_SUCCESS	190	Scheduled installation succeeded.		Installation Successful: Windows successfully installed the following update: %1.
AU_SCHEDULED_INSTALL_COMPLETE_WITH_REBOOT	191	Scheduled installation succeeded, requires reboot.		Installation successful and restart required for the following update: %1.
AU_SCHEDULED_INSTALL_KILLED	192	Scheduled installation timed out, was terminated by the WUA.		Installation killed: Installation of the following update is killed by the agent: %2
AU_SCHEDULED_INSTALL_FAILED	195	Scheduled installation failed.		Installation Failure: Windows failed to install the following update with error %1: %2.
AU_SHUTDOWN_INSTALL_SUCCESS	197	Install at shutdown succeeded.		Installation Successful: Windows successfully installed the following update:

Name	Event ID	Description	Remarks	English message template
				%1.
AU_SHUTDOWN_INSTALL_FAILED	198	Install at shutdown failed.		Installation Failure: Windows failed to install the following update with error %1: %2.
AU_SHUTDOWN_INSTALL_COMPLETE_WITH_REBOOT	199	Install at shutdown succeeded, requires reboot.		Installation successful and restart required for the following update: %1.
AU_SHUTDOWN_INSTALL_KILLED	200	Install at shutdown timed out, was terminated by the WUA.		Installation killed: Installation of the following update is killed by the agent: %2.
AGENT_INSTALLING_FAILED_POST_REBOOT	203	Post-reboot processing of an installed update failed.	New to Windows Vista	Installation Failure Post Reboot.
AGENT_UNINSTALLING_FAILED	221	Uninstallation failed.		Uninstallation Failure: Windows failed to uninstall the following update with error %1: %2.
AGENT_UNINSTALLING_SUCCEEDED	222	Uninstallation succeeded.		Uninstallation Successful: Windows successfully uninstalled the following update: %1.
AGENT_UNINSTALL_CANCEL	223	Uninstallation canceled.		User canceled the uninstall.
AGENT_UNINSTALL_COMPLETE_WITH_REBOOT	224	Uninstallation succeeded, requires reboot.		Uninstallation successful and restart required for the following update: %1.
AGENT_UNINSTALL_KILLED	225	Uninstallation timed out, was terminated by the WUA.		Uninstallation killed: Uninstallation of the following update is killed by the agent: %2.
Update Hidden/Unhidden Events				
AGENT_INSTALL_HIDE	185	User chose to hide the update from the UI.		Hide update: user hid one update.
AGENT_INSTALL_UNHIDE	196	User chose to unhide the update from the UI.		Unhide update: user unhide one update.
Misc Events				

Name	Event ID	Description	Remarks	English message template
AGENT_INSTALLING_PENDING	201	Self-update is about to begin.		Installation pending.
AU_REBOOT_COMPLETED	202	Client computer has finished rebooting following an install/uninstall.		Reboot completed.

Response:

```
<s:element name="ReportEventBatchResponse">
  <s:complexType>
    <s:sequence>
      <s:element minOccurs="1" maxOccurs="1" name="ReportEventBatchResult"
        type="s:boolean" />
    </s:sequence>
  </s:complexType>
</s:element>
```

ReportEventBatchResult: Upon successful completion of this operation, this MUST be returned. Its value MUST be TRUE if the events were successfully received by the server. Otherwise, it MUST be FALSE.

2.2.2.4 Faults

This protocol allows a server to notify a client of application-level faults by generating SOAP faults by using the following XML syntax.

It does this by throwing a SOAP fault (as specified in [SOAP1.1] section 4.4) with XML, which MUST have the following format in the faults "detail" element.

```
<ErrorCode>errorCode</ErrorCode>
```

```
<Message>message</Message>
```

```
<ID>id</ID>
```

```
<Method>method</Method>
```

errorCode: Identifies the type of exception being thrown, the value of which MUST be one of those in the following table. The Description column in the table below defines possible actions that the client SHOULD take in response to the error.

message: An ErrorCode-specific user friendly string. This MAY be omitted.

id: A server-generated GUID that uniquely identifies the particular instance of this fault. This can be used to look up additional diagnostic data about the fault in a log, for example.

ErrorCode	Description
InvalidCookie	The server cannot decrypt the cookie to validate it. The client MUST discard the cookie and start the initial handshake again by calling GetConfig (section 2.2.2.2.1), GetAuthorizationCookie (section 2.2.2.1.1), GetCookie (section 2.2.2.2.2), and RefreshCache (section 2.2.2.2.5).
ConfigChanged	The server configuration has changed since the last time the client called

ErrorCode	Description
	GetConfig (section 2.2.2.2.1). The client MUST call GetConfig, GetAuthorizationCookie (section 2.2.2.1.1), and GetCookie (section 2.2.2.2.2) again.
RegistrationRequired	Client registration is required. The client SHOULD call RegisterComputer (section 2.2.2.2.3) before calling SyncUpdates (section 2.2.2.2.4) again.
ServerChanged	The server's identity or state has changed. The client MUST discard the cookie and start the initial handshake again by calling GetConfig (section 2.2.2.2.1), GetAuthorizationCookie (section 2.2.2.1.1), GetCookie (section 2.2.2.2.2), and RefreshCache (section 2.2.2.2.5).
InternalServerError	An internal error has occurred in the server while processing the request. The client SHOULD try the failed operation again later.
CookieExpired	The client is using an expired cookie that the server is able to decrypt. It MUST call GetAuthorizationCookie (section 2.2.2.1.1) and GetCookie (section 2.2.2.2.2) again to renew its expired cookie.
InvalidParameters	The client has passed invalid parameters to the server. The "message" part of the exception will contain the parameter name.
InvalidAuthorizationCookie	The authorization cookie passed to GetCookie (section 2.2.2.2.2) is invalid.
RegistrationNotRequired	The client has called RegisterComputer (section 2.2.2.2.3) even though the server told it not to in the GetConfig (section 2.2.2.2.1) response.
ServerBusy	The server is too busy to handle this request. The client SHOULD try again later.
FileLocationChanged	The file locations have changed since the last time the client synced. The client SHOULD call GetFileLocations (section 2.2.2.2.7) to get the current file locations.

method: A string indicating the web service method in which the fault occurred. This can be omitted.

2.2.2.5 Update Content Directory and Self-Update Content Directory

Both the update content directory and self-update content directory MUST support HTTP requests, as specified in [RFC2616]. The update content directory and the self-update content directory MUST support HTTP HEAD and GET (range) request messages. The locations of the update content directory and the self-update content directory are specified in section 2.1.

2.2.3 Complex Types

The following sections define the common complex types that are used in this protocol.

2.2.3.1 ArrayOfInt

An array of integer values used in messages within the protocol.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="ArrayOfInt">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" name="int"
      type="s:int" />
  </s:sequence>
```

```
</s:complexType>
```

2.2.3.2 ArrayOfString

An array of string values used in messages within the protocol.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="ArrayOfString">  
  <s:sequence>  
    <s:element minOccurs="0" maxOccurs="unbounded" name="string"  
      nillable="true" type="s:string" />  
  </s:sequence>  
</s:complexType>
```

2.2.3.3 ArrayOfGuid

An array of GUID values used in messages within the protocol.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="ArrayOfGuid">  
  <s:sequence>  
    <s:element minOccurs="0" maxOccurs="unbounded" name="guid"  
      type="s2:guid" />  
  </s:sequence>  
</s:complexType>
```

2.2.3.4 AuthorizationCookie

An object returned by the server on successful completion of the GetAuthorizationCookie (section 2.2.2.1.1) operation.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="AuthorizationCookie">  
  <s:sequence>  
    <s:element minOccurs="0" maxOccurs="1" name="PlugInId"  
      type="s:string" />  
    <s:element minOccurs="0" maxOccurs="1" name="CookieData"  
      type="s:base64Binary" />  
  </s:sequence>  
</s:complexType>
```

PlugInId: Name identifying the Authorization PlugIn issuing the AuthorizationCookie.

CookieData: An opaque sequence of one or more bytes containing implementation-specific authorization and authentication information for use by the server. The format of this data, including the type of encryption used, if any, is implementation-specific. Different server implementations can use different data formats that are not always compatible. A server SHOULD return an InvalidCookie error if passed an AuthorizationCookie that a client obtained from another server.

The data SHOULD include the client ID and the target groups to which the client belongs. The server can implement authentication by using the client ID and can implement authorization by using both the client ID and target groups. This element MUST be present.

2.2.3.5 Cookie

Used by the server to store client authorization, authentication, and protocol state information in a format opaque to the client.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="Cookie">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="Expiration"
      type="s:dateTime" />
    <s:element minOccurs="0" maxOccurs="1" name="EncryptedData"
      type="s:base64Binary" />
  </s:sequence>
</s:complexType>
```

Expiration: A clear-text copy of the time this Cookie expires. The actual time the Cookie expires SHOULD be stored in EncryptedData to prevent client tampering.

EncryptedData: An opaque sequence of one or more bytes that contain implementation-specific authorization, authentication, and protocol state information for use by the server. The format of this data, including the type of encryption used, if any, is implementation-specific. Different server implementations can use different data formats that are not always compatible. A server SHOULD return an InvalidCookie error if passed a Cookie that a client obtained from another server.

The data SHOULD include the client ID, the target groups the client belongs to; the Cookie expiration time; the client protocol version; the last time the client synchronized software, drivers, and printer catalog; and the server's identity. This element MUST be present.

2.2.3.6 UpdateIdentity

A globally unique identifier (GUID) for a specific revision of an update.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="UpdateIdentity">
  <s:sequence>
    <s:element minOccurs="1" maxOccurs="1" name="UpdateID"
      type="s2:guid" />
    <s:element minOccurs="1" maxOccurs="1" name="RevisionNumber"
      type="s:int" />
  </s:sequence>
</s:complexType>
```

UpdateID: A GUID that identifies an update.

RevisionNumber: A 32-bit number that uniquely identifies a specific version of an update. These types are specified in the Abstract Data Model (section 3.1.1).

2.2.3.7 ArrayOfBase64Binary

An array of binary values encoded in base 64.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:complexType name="ArrayOfBase64Binary">
  <s:sequence>
    <s:element minOccurs="0" maxOccurs="unbounded" />
  </s:sequence>
</s:complexType>
```

```
        name="base64Binary" nillable="true"
        type="s:base64Binary" />
    </s:sequence>
</s:complexType>
```

2.2.4 Simple Types

The following sections define the common simple types that are used in this protocol.

2.2.4.1 Guid

Simple type corresponding to a GUID or uniqueidentifier.

Defined in namespace: <http://www.microsoft.com/SoftwareDistribution>.

```
<s:simpleType name="guid">
  <s:restriction base="s:string">
    <s:pattern value="[0-9a-fA-F]{8}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{4}-[0-9a-fA-F]{12}" />
  </s:restriction>
</s:simpleType>
```

3 Protocol Details

This protocol operates between a client (the initiator) and a server (the responder).

The protocol incorporates mechanisms to enable stateless server operation wherever possible. In particular, a server generates an encrypted cookie that encapsulates the server's protocol state with respect to each client, and the server requires the client to retain that cookie on its behalf. The client presents its cookie when invoking methods against the server, and the server updates the cookie as appropriate over the course of its communication with the client.

3.1 Server Details

3.1.1 (Updated Section) Abstract Data Model

This section describes a conceptual model and possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as the external behavior is consistent with that described in this document.

In the following illustration, each table specifies a type of entity in the model, and each arrow specifies that one type of entity always contains a reference to another.

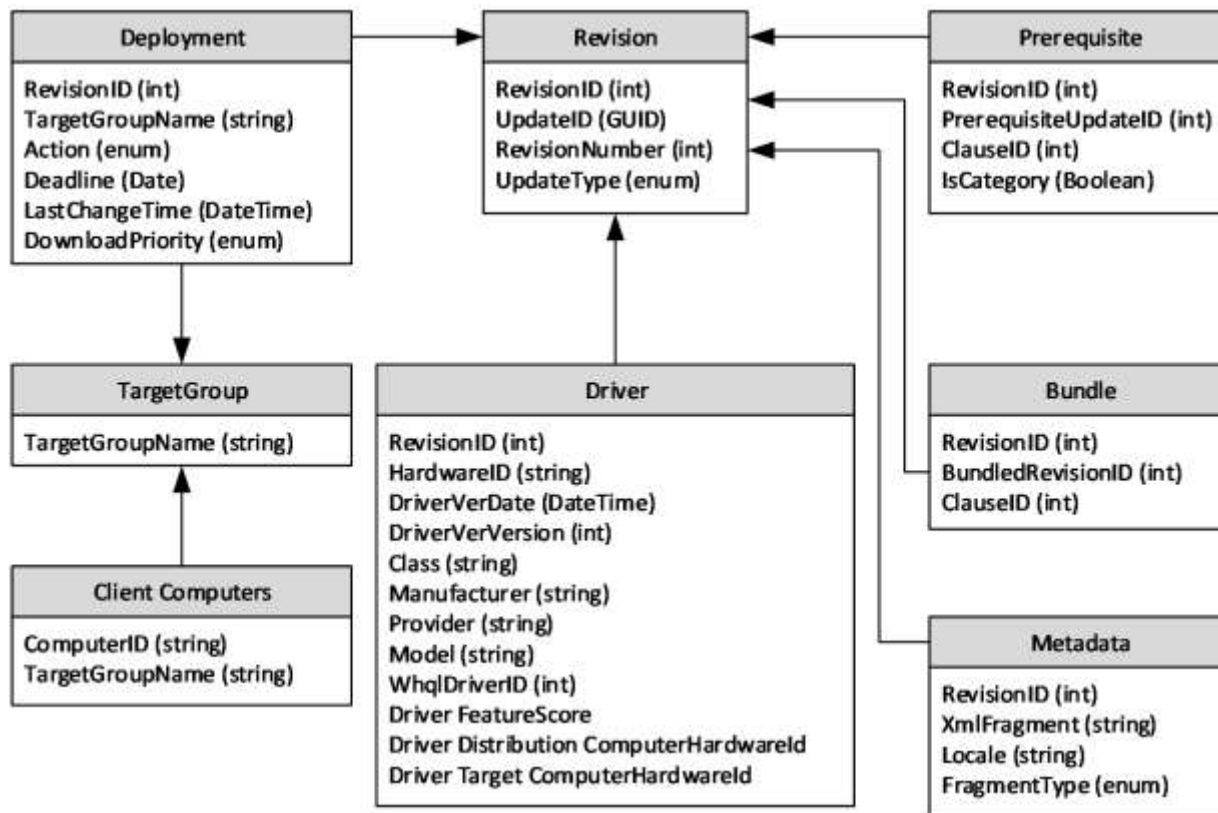

Figure 2: Server abstract data model

Revision Table: A collection of entries corresponding to the revisions available on the server. Each entry is uniquely identified by an UpdateID and RevisionNumber, and is also independently identified uniquely by a RevisionID. Each entry includes the following elements:

- **RevisionID:** A server-assigned revision identifier. Because it is more compact than the globally unique (UpdateID, RevisionNumber) pair, the RevisionID is used as the revision identifier during client/server communications to minimize network traffic.
- **UpdateID:** A GUID that is the same for all revisions of an update.
- **RevisionNumber:** Used in conjunction with the UpdateID to uniquely identify the revision.
- **UpdateType:** Specifies whether the update is a Driver, Software, Category, or Detectoid. The SyncUpdates (section 2.2.2.2.4) method treats Drivers and non-drivers differently, as specified in section 3.1.5.7.

This ADM element contains data that overlaps with the Revision Table specified in [MS-WSUSSS] section 3.1.1.

Driver Table: A collection of entries corresponding to the revisions available on the server with an UpdateType of "Driver". Each entry is uniquely identified by a RevisionID. Each entry includes the following elements:

- **RevisionID:** A reference to the revision of the driver.
- **HardwareID:** A value that identifies the device hardware supported by the driver.
- **DriverVerDate:** The release date of the driver.
- **DriverVerVersion:** The software version of the driver.
- **Class:** The device function class of the driver.
- **Manufacturer:** The company that created the driver.
- **Provider:** The company providing the driver.
- **Model:** The model of hardware that the driver targets.
- **WhqlDriverID:** The ID assigned to this driver as part of the driver certification process. A higher number means the driver was submitted to the Microsoft Update live service more recently.

Driver FeatureScore Table: A collection of entries corresponding to the various feature score values for a driver revision per operating system (the same driver can have different feature scores on different operating system versions). FeatureScore is an additional metadata element used to rank drivers.

- **OperatingSystem:** A string that defines the specific architecture and operating system for a particular feature score. The format is [Arch].[OSMajorVersion].[OSMinorVersion].<29>
- **FeatureScore:** An integer value from 0-255 that represents the feature score of the driver. A lower feature score value is considered better.
- **RevisionID:** A reference to a specific driver revision.
- **HardwareID:** A value that identifies the device to which the feature score applies.

Driver Distribution ComputerHardwareID Table: A collection of entries corresponding to the distribution-targeted ComputerHardwareID values for a specific driver revision. A driver can be targeted to a particular computer HardwareId at the distribution level within the service or at the INF level within the driver package.

- **DistributionComputerHardwareId:** A GUID that represents a set of computer systems to which this driver revision is distribution-targeted for a specific device HardwareId.
- **RevisionID:** A reference to a specific driver revision.
- **HardwareID:** A value that identifies the device to which this distribution computer HardwareId applies.

Driver Target ComputerHardwareID Table: A collection of entries corresponding to the INF-targeted ComputerHardwareID values for a specific driver revision.

- **TargetComputerHardwareId:** A GUID that represents a set of targeted computer systems that this driver revision is INF-targeted to for a specific device HardwareId.
- **RevisionID:** A reference to a specific driver revision.
- **HardwareID:** A value that identifies the device to which this distribution computer HardwareId applies.

Metadata Table: A collection of metadata fragments, which are derived from the revision metadata, as specified in section 3.1.1.1. Each entry is uniquely identified by the combination of its RevisionID, FragmentType, and locale. Each entry includes the following elements:

- **RevisionID:** A reference to the revision that this fragment was derived from.
- **XmlFragment:** The metadata fragment.
- **FragmentType:** The type of fragment: Core, Extended, LocalizedProperties, or Eula.
- **Locale:** For entries with FragmentType of LocalizedProperties or Eula, specifies the locale of the entry. NULL for entries of other FragmentTypes.

Prerequisite Table: A collection of relationships between updates. An update's prerequisites are specified in conjunctive normal form (CNF); for example, (U6 OR U8) AND (U2) AND (U5 OR U3). A client does not treat a revision as requiring installation unless its prerequisites are satisfied (that is, at least one update in each CNF disjunctive clause is installed on the client). Each entry is uniquely identified by the combination of its RevisionID, PrerequisiteUpdateID, and ClauseID. Each entry includes the following elements:

- **RevisionID:** A reference to a revision that has a prerequisite relationship on other updates.
- **PrerequisiteUpdateID:** A reference to a revision that is a prerequisite. Only the UpdateID is declared, but the reference implicitly refers to the revision with the highest RevisionNumber that has the specified UpdateID.
- **ClauseID:** Specifies the CNF "AND clause" in which the prerequisite appears. The ClauseID is used to group each disjunctive clause. In the above example, U6 and U8 have the same ClauseID in this table.
- **IsCategory:** Specifies whether the prerequisite is an update category.

Bundle Table: A collection of relationships between updates. Bundled updates are specified in CNF form; for example, (R6 OR R8) AND (R2) AND (R5 OR R3). Each entry is uniquely identified by the combination of its RevisionID, BundledRevisionID, and ClauseID. Each entry includes the following elements:

- **RevisionID:** A reference to a revision that bundles other revisions.
- **BundledRevisionID:** A reference to a bundled revision.

- **ClauseID:** Specifies the CNF "AND clause" in which the bundled revision appears. The ClauseID is used to group each disjunctive clause. In the above example, R6 and R8 have the same ClauseID in this table.

TargetGroup Table: A collection of named groups of clients. Each entry is uniquely identified by a TargetGroupName, the only element in each entry.

This ADM element contains data that overlaps with the TargetGroup Table specified in [MS-WSUSSS] section 3.1.1.

Client Table: A collection of clients. Each entry is uniquely identified by a ComputerID. Each entry includes the following elements:

- **ComputerID:** A unique identifier for the client. The server SHOULD use ComputerID to identify clients. A suitable unique identifier is the *clientID* parameter passed to the GetAuthorizationCookie (section 2.2.2.1.1) method.
- **TargetGroupName:** A reference to the target group to which this client belongs.

This ADM element contains data that overlaps with the Client computer table specified in [MS-WSUSSS] section 3.1.1.

Deployment Table: A collection of administrator-defined specifications that state that specific revisions will be made available to specific clients. Each entry is uniquely identified by the combination of its RevisionID and TargetGroupName. Each entry includes the following elements.

- **RevisionID:** A reference to the deployed revision.
- **TargetGroupName:** A reference to the target group to which the revision is deployed.
- **Action:** The action that clients in the specified target group will perform on this revision: **OptionalInstall**, Install, Uninstall, PreDeploymentCheck (which means that clients will not offer the update, just report back on the status), Block (which means that the update will not be deployed, and is used to override another deployment), Evaluate (which means that clients will not offer the update and will not report back on the status), or Bundle (which means that clients will not offer the update for install; it is only deployed because it is bundled by some other explicitly deployed update).
- **LastChangeTime:** The time the deployment was last modified.
- **DownloadPriority:** Specifies whether the client will download the revision's content as high-, medium-, or low-priority relative to other content needed by the client.
- **Deadline:** An optionally specified time by which clients SHOULD perform the deployment action.

This ADM element contains data that overlaps with the Deployment Table specified in [MS-WSUSSS] section 3.1.1.

3.1.1.1 Populating the Data Model

The server implementation extracts information for the data model from the update metadata. Except as specified below, the update metadata does not need to be interpreted by the server. Because the metadata is well-formed XML, the properties specified below can all be extracted using XPATH queries, as specified in [XPATH]. The manner in which the server obtains the update metadata is specified in [MS-WSUSSS] (section 3.1.4.6, GetUpdateData).

Revision Table

There is one entry in the revision table for each metadata revision in the server. The RevisionID element is populated with a unique server-assigned value. The remaining elements are populated from the revision metadata using the following unqualified XPATHs.

Property	XPATH
UpdateID	/Update/UpdateIdentity/@UpdateID
RevisionNumber	/Update/UpdateIdentity/@RevisionNumber
UpdateType	/Update/Properties/@UpdateType

Driver Table

There is at least one entry in the driver table for each entry in the revision table with UpdateType=Driver. The **RevisionID** element is populated with a reference to the associated entry in the revision table. The remaining elements are populated from the revision metadata using the following unqualified XPATHs.

Property	XPATH
HardwareID	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@HardwareID
DriverVerDate	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@DriverVerDate
DriverVerVersion	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@DriverVerVersion
Class	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@Class
Manufacturer	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@Manufacturer
Provider	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@Provider
Model	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@Model
WhqlDriverID	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@WhqlDriverID

Driver FeatureScore Table

There can be anywhere from 0 to an unlimited number of FeatureScore entries per RevisionID/HardwareID. The **RevisionID** element is populated with a reference to the associated entry in the revision table. The remaining elements are populated from the revision metadata using the following unqualified XPATHs.

Property	XPATH
HardwareID	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@HardwareID
OperatingSystem	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/FeatureScore/@OperatingSystem
FeatureScore	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/FeatureScore/@FeatureScore

Driver Distribution ComputerHardwareID Table

There can be anywhere from 0 to an unlimited number of Distribution ComputerHardwareID entries per RevisionID/HardwareID. The **RevisionID** element is populated with a reference to the associated entry in the revision table. The remaining elements are populated from the revision metadata using the following unqualified XPATHs.

Property	XPATH
HardwareID	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@HardwareID
DistributionComputerHardwareId	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/ DistributionComputerHardwareId/text()

Driver Target ComputerHardwareID Table

There can be anywhere from 0 to an unlimited number of Target ComputerHardwareID entries per RevisionID/HardwareID. The **RevisionID** element is populated with a reference to the associated entry in the revision table. The remaining elements are populated from the revision metadata using the following unqualified XPATHs.

Property	XPATH
HardwareID	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/@HardwareID
TargetComputerHardwareId	/Update/ApplicabilityRules/Metadata/WindowsDriverMetaData/ TargetComputerHardwareId/text()

Prerequisite Table

There is one entry in the prerequisite table for each prerequisite relationship declared in the revision metadata. The **RevisionID** element is populated with a reference to an entry in the revision table corresponding to the revision metadata declaring the prerequisite relationship. The **PrerequisiteUpdateID** element is populated by using one of the following unqualified XPATHs.

Property	XPATH
PrerequisiteUpdateID	/Update/Relationships/Prerequisites/AtLeastOne/UpdateIdentity/@UpdateID
PrerequisiteUpdateID	/Update/Relationships/Prerequisites/UpdateIdentity/@UpdateID

The server-assigned **ClauseID** element is the same between different entries in the table if and only if:

- The entries have the same **RevisionID** element, and
- The entries were populated from the same AtLeastOne XML element from the revision metadata as defined by the following XPATH:
/Update/Relationships/Prerequisites/AtLeastOne/UpdateIdentity/@UpdateID.

If the **PrerequisiteUpdateID** element was populated with the first XPATH query in the preceding table, then the **IsCategory** element is populated using the following XPATH query:

/Update/Relationships/Prerequisites/AtLeastOne/@IsCategory

Otherwise, the **IsCategory** element is populated with FALSE.

Bundle Table

There is one entry in the bundle table for each bundle relationship declared in the revision metadata. Each entry has the **RevisionID** element populated with a reference to the entry in the revision table corresponding to the revision metadata that declares the prerequisite relationship.

There is one entry in the table for each node returned from the following XPATH query:

/Update/Relationships/BundledUpdates/AtLeastOne/UpdateIdentity

The entry has the following elements:

RevisionID: Set to the RevisionID of the metadata declaring the bundle relationship.

BundledRevisionID: Set to the RevisionID of the entry in the revision table whose UpdateID and RevisionNumber match the values in the XPATH query above.

ClauseID: This server-assigned element is the same between different entries in the table if and only if:

- The entries have the same **RevisionID** element, and
- The entries were populated from the same AtLeastOne XML element from the revision metadata as defined by the following XPATH: /Update/Relationships/BundledUpdates/AtLeastOne/UpdateIdentity.

Metadata Table

The metadata table is populated with metadata fragments generated from the original metadata. For each revision, the server generates the following entries in the metadata table.

Core: There is exactly one "Core" entry created from the revisions metadata.

RevisionID: References the entry in the revision table for the revisions metadata.

FragmentType: Core.

Locale: NULL.

XmlFragment: MUST be derived from the original metadata by:

- Collecting the following XmlNodeNodes:
 - The XmlNode identified by XPATH /Update/UpdateIdentity
 - The XmlNode identified by XPATH /Update/Properties, all attributes removed except: UpdateType, ExplicitlyDeployable, AutoSelectOnWebSites, OSUpgrade, and EulaID
 - The XmlNode identified by XPATH /Update/Relationships
 - The XmlNode identified by XPATH /Update/ApplicabilityRules
- Then, for each XmlNode, it MUST transform element names as follows:
 - Prepend "b." to any element in namespace <http://schemas.microsoft.com/msus/2002/12/BaseApplicabilityRules>
 - Prepend "m." to any element in namespace <http://schemas.microsoft.com/msus/2002/12/MsiApplicabilityRules>
 - Prepend "d." to any element in namespace <http://schemas.microsoft.com/msus/2002/12/UpdateHandlers/WindowsDriver> <30>
- Next, strip all namespace definitions.

Note The resulting fragment is not well-formed XML.

Extended: There is exactly one "Extended" entry created from the revisions metadata.

RevisionID: References the entry in the revision table for the revisions metadata.

FragmentType: Extended.

Locale: NULL.

XmlFragment: MUST be derived from the original metadata by concatenating the following strings together after removing all XML namespace definitions from each string (the result of which is not well-formed XML):

- The XmlNode identified by XPATH /Update/Properties, with the following attributes removed: UpdateType, ExplicitlyDeployable, AutoSelectOnWebSites, EulaID, PublicationState, PublisherID, CreationDate, IsPublic, LegacyName, DetectoidType, OSUpgrade.
- The XmlNode identified by XPATH /Update/Files.
- The XmlNode identified by XPATH /Update/HandlerSpecificData.

LocalizedProperties: There are one or more "LocalizedProperties" entries that are created from the revision's metadata: one for each XmlNode, N, with unqualified XPATH /Update/LocalizedPropertiesCollection/LocalizedProperties.

RevisionID: References the entry in the revision table for the revisions metadata.

FragmentType: LocalizedProperties.

XmlFragment: Strip namespaces from the XmlNode.

Locale: The "Language" sub-element of the XmlNode.

Eula: There are zero or more "Eula" entries created from the revision's metadata: one for each XmlNode, N, with unqualified XPATH /Update/LocalizedPropertiesCollection/EulaFile.

RevisionID: References the entry in the revision table for the revision's metadata.

FragmentType: Eula.

XmlFragment: Strip namespaces from the XmlNode.

Locale: The "Language" attribute of the XmlNode.

Note Clients don't use the EULA fragments obtained from a Windows Server Update Services (WSUS) server (this fragment is only used by clients talking to the WSUS). Instead, a WSUS server administrator MUST accept EULAs on behalf of clients.<31>

Client Table

This protocol does not mandate a specific mechanism for populating this table. Implementations can do so via administrative configuration , at runtime, or by other means.<32>

Target Group Table

This protocol does not mandate a specific mechanism for populating this table. Implementations can do so by implementation-specific<33> means.

Deployment Table

This protocol does not mandate a specific mechanism for populating this table. Implementations can do so by implementation-specific<34> means.

3.1.2 Timers

None. All protocol requests are initiated by the client.

3.1.3 Initialization

The following initialization steps **MUST** be performed.

1. All tables in the abstract data model contain persistent data that **MUST** be retrieved from persistent storage at initialization time.
2. Each web service within the server **MUST** begin listening for requests at the respective URL addresses given in the message transport (as specified in section 2.1).
3. The update content directory and self-update content directory **MUST** be made available at the URL address given in the message transport (as specified in section 2.1).

3.1.4 Higher-Layer Triggered Events

There are no higher-layer triggered events. All protocol requests are initiated by the client.

3.1.5 Message Processing Events and Sequencing Rules

The following high-level sequence diagram illustrates the operation of the protocol.

Figure 3: Message processing sequence of this protocol

Self-update, authorization, and metadata sync MUST always be performed in the sequence illustrated in this diagram, although specific steps in the sequence can be omitted as an optimization. Many of the web method calls in the sequence produce an output that is needed as input to the next web method call, therefore the overall ordering of the web method calls need to be maintained. Content download and event reporting SHOULD be performed asynchronously from other operations. Each of these operations is specified in more detail in the following sections.

3.1.5.1 Self-Update

At the start of the protocol, a client that implements the self-update protocol SHOULD check if it needs to self-update. Client/server communications can fail if the server does not expose the self-update content directory, as specified in this section.

As specified in section 2, the server implementation MUST expose the self-update content directory as a virtual directory. Clients that support the self-update protocol issue HTTP GET requests (as specified in [RFC2616] section 9.3) to obtain files from the self-update content directory; therefore, the server MUST support HTTP requests on this virtual directory to support these clients. The files that the client accesses in the self-update directory, and the way in which the client uses them, are implementation-specific

3.1.5.2 GetConfig

Synopsis:

This method returns configuration information on the server. It MUST be the initial method called by the client when connecting to the server. The client SHOULD cache the results of this call and only call it again if the server throws a SoapFault with one of the following ErrorCodes: InvalidCookie, ServerChanged, or ConfigChanged.

Request Validation:

Parameter	Validation Conditions	ErrorCode
protocolVersion	MUST be a non-NULL two-part version string (for example, "1.0").	If the validation conditions are not met, the server MAY return InvalidParameters.

Results:

If no faults occur during the operation, the server MUST return a GetConfigResponse message in response to the client.

3.1.5.3 GetAuthorizationCookie

Synopsis:

This method provides a mechanism for the server to authenticate and authorize client access to the client Web service.

The client SHOULD only call this method to renew its cookie, either because the cookie expired or because the server has thrown a SoapFault with one of the following ErrorCodes: InvalidCookie, ServerChanged, ConfigChanged, or CookieExpired. If this method is called in response to one of these errors, it MUST be called in the sequence specified for the error in section 2.2.2.4.

Request Validation:

Parameter	Validation Conditions	Error Code
clientID	MUST be a non-NULL ClientIdString.	InvalidParameters or InternalServerError<37>
dnsName	MUST be a non-NULL string consistent with DNS naming requirements.	InvalidParameters or InternalServerError<38>

Data processing:

As a result of this request, the server SHOULD persist the provided client information and add the client to the requested target group, if supported. Alternatively, the client MAY disregard the provided client information (if the server does not need this information to implement the desired levels of reporting) and/or the provided target group (if the server does not support target groups or uses another method of assigning client computers to target groups).

Results:

If no faults occur during the operation, the server MUST return a GetAuthorizationCookieResponse message to the client.

3.1.5.4 GetCookie

Synopsis:

This method is called by the client during the initial dialog between the client and the server. It **MUST** be called after GetConfig (section 3.1.5.2) and GetAuthorizationCookie (section 3.1.5.3), but before calling any other operation. The cookie returned by the method **MUST** be passed to all subsequent operations in the client Web service. The client **SHOULD** cache the cookie and call this method only to renew the cached cookie, either because the cookie expired or because the server has thrown a SoapFault with one of the following ErrorCodes: InvalidCookie, ServerChanged, ConfigChanged, or CookieExpired. If this method is called in response to one of these errors, it **MUST** be called in the sequence specified for the error in section 2.2.2.4.

Request Validation:

Parameter	Validation Conditions	Error Code
authCookies	MUST contain exactly one Authorization Cookie—the one returned from GetAuthorizationCookie (section 3.1.5.3).	InvalidAuthorizationCookie
oldCookie	MUST either be NULL or contain a valid cookie issued by this server (typically an expired cookie).	InvalidCookie or ServerChanged
lastChange	MUST be the same as the last time the configuration changed on the server (although this check can be done in SyncUpdates (section 3.1.5.7) instead).	ConfigChanged
protocolVersion	SHOULD be a non-NULL two-part version string (for example, "1.0").	InvalidParameters

Data Processing:

The returned cookie **SHOULD** contain opaque authorization, authentication, and state information for use by the server. This information can include the following:

- Client identity and target group membership (as extracted from the cookie returned by the SimpleAuth Web service).
- Cookie expiration time (enabling the server to determine whether the cookie has expired).
- Server identity (enabling the server to verify that it issued the cookie).
- Client protocol version (enabling the server to implement version-specific behavior).
- Configuration "lastChange" time (enabling the server to determine whether to force the client to call GetConfig (section 3.1.5.2) again).
- The client's last synchronization time.

The server **SHOULD** copy state information from the oldCookie element to the new cookie it returns from this method, providing the oldCookie was obtained from the same server. Alternatively, the client **MAY** disregard the oldCookie's state information and generate new state information as if the client had passed an oldCookie value of NULL.

Results:

If no faults occur during the operation, the server **MUST** return a GetCookieResponse message to the client.

3.1.5.5 RegisterComputer

Synopsis:

The client calls this method to pass information about itself to the server. The client **MUST** call this method if the server has returned `IsRegistrationRequired=true` from the client's most recent preceding call to `GetConfig` (section 3.1.5.2). The client **SHOULD** only call this method again if any of its registration information has changed, or if the server has requested it be called again by throwing a `RegistrationRequired` `ErrorCode` while processing a subsequent method invocation.

Request Validation:

Parameter	Validation Conditions	Error Code
cookie	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
computerInfo	MAY perform validation of these fields.	InvalidParameters

Note Validation of the `computerInfo` data is optional, because this data is purely informational and is not used anywhere else in the client/server protocol.

Data Processing:

The server **SHOULD** store client registration info on the server so that administrators can see the types of computers that are getting updates from the server. This is not required because the cookie is created and maintained through the **GetCookie** method (section 3.1.5.4), and the `computerInfo` is purely informational and is not used anywhere else in the client/server protocol. If the server does not store this information, then the server will generally take no action in response to this method (other than validating parameters and returning a result). A server that does not store client registration information could include `IsRegistrationRequired=false` in its response to **GetConfig** (section 3.1.5.2), to inform the client that a call to the **RegisterComputer** method is not needed.

Results:

If no faults occur during the operation, the server **MUST** return a `RegisterComputerResponse` message to the client.

3.1.5.6 StartCategoryScan

Synopsis:

Clients can perform update synchronization that is limited to a set of update categories by using the `SyncUpdates` operation. The `StartCategoryScan` method enables the client to obtain the preferred set of categories that the server expects as part of the `SyncUpdates` method parameters. It also allows the client to obtain any requested categories that are not recognized by the server.

When a client is performing limited update synchronization of a category, it **MUST** call the `StartCategoryScan` method before calling the `SyncUpdates` method. The client **MUST NOT** call this method if the "ProtocolVersion" `ConfigurationProperty` from the `GetConfig` response (section 2.2.2.2.1) is less than "3.2". This method **SHOULD NOT** exist on servers that return a "ProtocolVersion" less than "3.2".

Request Validation:

Parameter	Validation conditions	Error code
requestedCategories	MUST be present	InvalidParameters

The server SHOULD limit the number of categories being requested as an optimization.<39>

Data Processing:

The input to this method is an array of **CategoryRelationship** elements as specified in section 2.2.2.2.8.

The server MUST follow the rules specified below to compute the PreferredCategoryList and ErrorList:

1. For each **CategoryRelationship** element, if the server does not recognize the category identified by the CategoryId GUID, it places that CategoryID in the ErrorList. In addition, the group of CategoryRelationship elements that are identified by the same IndexOfAndGroup value is removed from the input.
2. For each of the remaining CategoryRelationship groups:
 - If the group contains one CategoryID that identifies a product category, that CategoryID is added to the PreferredCategoryList.
 - If the group contains two CategoryIDs, one of which identifies a product category and the other identifies an update classification category, only the CategoryID of the product category is added to the PreferredCategoryList.
 - All other cases are not allowed, in which case, the PreferredCategoryList is cleared of any existing entries and processing stops.

Results:

If no faults occur during this operation, the server MUST return a StartCategoryScanResponse message to the client (section 2.2.2.2.8). It MUST generate the response as follows:

StartCategoryScanResponse.preferredCategoryIds: This MUST be populated with the list of category GUIDs from the PreferredCategoryList, which is computed as specified previously.

StartCategoryScanResponse.requestedCategoryIdsInError: This MUST be populated with the category GUIDs from the ErrorList, which is computed as specified previously.

3.1.5.7 SyncUpdates

Synopsis:

This is the main operation that supports the synchronization of update metadata to client computers (2). It is invoked to perform both software and driver metadata synchronization. Software update synchronization SHOULD be performed first, using a sequence of calls to this method as described below. Driver synchronization SHOULD then be performed using a single call to the method.

During the Software update synchronization phase, the client MUST call the SyncUpdates method with the **SkipSoftwareSync** field in the *SyncUpdateParameters* input parameter set to false. The client MUST make multiple calls to this method to retrieve all applicable software updates from the server. The client MUST follow the below rules to determine the input parameters for each call in the sequence and to determine when to stop:

The client MUST

1. First call SyncUpdates with **InstalledNonLeafUpdateIDs** field set to empty.
2. Check if the **NewUpdates** element in the result is empty. If it is empty, then the software update synchronization is complete.

3. Otherwise, evaluate the applicability of updates in the result of the call and collect applicable updates into a list. The applicability evaluation is performed using the metadata contained in the XmlFragments provided by the server and is implementation-specific.<40>
4. From the list compiled in step 3, select those updates that evaluated as installed and which are marked with the **IsLeaf** field as false in the **UpdateInfo** structure and append their IDs to the InstalledNonLeafUpdateIDs sent in the last call to SyncUpdates. From the remaining updates in the list, select those that are drivers and append their IDs to the CachedDriverIDs sent in the last call to SyncUpdates. For the remaining updates in the list, append their IDs to the OtherCachedUpdateIDs sent in the last call to SyncUpdates. Call SyncUpdates again and continue from step 2.

Request Validation:

Parameter	Validation conditions	Error code
cookie	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
Parameters	MUST be specified.	InvalidParameters

Additional checks the server MUST perform:

- If **Parameters.SystemSpec** is present and **Parameters.SkipSoftwareSync** is FALSE, throw an InvalidParameters ErrorCode.

Data Processing:

The data processing specified in this section references most of the elements of the abstract data model, as specified in section 3.1.1.

The server MUST check whether the configuration data returned from GetConfig (section 3.1.5.2) has changed since the last time the client synchronized and, if so, throw a ConfigChanged ErrorCode fault.

The server checks whether client registration is required but the client is not yet registered. If so, it SHOULD throw a RegistrationRequired ErrorCode.

The following rules for driver matching are implemented by the server. Given any two drivers in the driver table as specified in the Abstract Data Model (section 3.1.1), the server MUST conclude that one of the two is a better match for a device listed in the system specification if one of the following rules applies:

- It is targeted to a more specific Computer HardwareId match for the client system that is listed earlier in the ComputerHardwareIDs section of the system spec XML.
- Both Computer HardwareId matches are the same specificity, but it has a better feature score, meaning the feature score value was lower.
- ComputerHardwareIDs and FeatureScores are the same, but it has a better HardwareID match: the one driver HardwareID matches on a device HardwareID or CompatibleID that is listed earlier in the device XML.
- ComputerHardwareIDs, FeatureScores, and HardwareIDs are equal matches, but the one driver has a more recent DriverVerDate.
- ComputerHardwareIDs, FeatureScores, HardwareIDs, and DriverVerDate are the same, but the one driver has a higher DriverVerVersion (after converting the four-part version string to a 64-bit integer).

Given a collection of drivers and a particular device listed in the system spec, the "best" driver for that device is determined by applying the above rules repeatedly to each pair-wise combination of drivers, discarding any driver not deemed "better" in a given pair-wise combination. The last remaining driver is the "best" match.

Given the above rules, the next step is for the server to compute the NeededRevisions list for the client. The server MUST do so as follows:

1. Restrict the set of revisions to those that are deployed to the client computer's target group, combined with any dependencies (prerequisite or bundle) of such updates.
2. Restrict the resulting set further to those revisions whose prerequisites are satisfied by the updates whose revision IDs are specified in **Parameters.InstalledNonLeafUpdateIDs**.
3. Restrict the resulting set further to either:
 - If performing software update synchronization (SkipSoftwareSync = false): revisions with UpdateType = Software.
 - If performing driver synchronization (SkipSoftwareSync = true): revisions for which all the following conditions hold:
 - UpdateType = Driver, and
 - The revision has an entry in the driver table that MUST be the "best" match for one of the devices in the system spec, and
 - If there is already a driver installed on the device:
 - The revision has an entry in the driver table that MUST be a "better" match than the installed driver, and
 - If the installed driver is a printer (Class='Printer'), then the revision MUST have an entry in the driver table which matches the Provider and Manufacturer for the installed driver.

Next, the server MUST generate the list of CachedRevisions for the client as follows:

- If performing software synchronization (SkipSoftwareSync = false), take the union of revisions in **Parameters.InstalledNonLeafUpdateIDs** and **Parameters.OtherCachedUpdateIDs**.
- If performing driver synchronization (SkipSoftwareSync = true), take the revisions listed in Parameters.CachedDriverIDs.

Results:

If no faults occur during the operation, the server MUST return a SyncUpdatesResponse message to the client. It MUST generate the response as follows:

- **SyncUpdatesResponse.NewUpdates:** Populated with entries for revision in the NeededRevisions list that are not in the CachedRevisions list:
 - **ID:** The revision ID.
 - **Deployment:**

Information about the deployment to this revision. If this revision was not itself explicitly deployed to the client by an administrator (for example, it was included in the NeededRevisions list because it was a dependency of an explicitly deployed revision), the DeploymentAction MUST be set to "Evaluate". For driver updates (UpdateType = driver), when the client reports a protocolVersion of "1.6" or higher in the GetCookie call, the server

SHOULD include all the HardwareIDs associated with this revision from the driver table that are selected as "best" matches.<41>

- **IsLeaf:** Specifies whether the revision is a leaf on the prerequisite graph or not. In particular, that there are no entries in the abstract data model Prerequisite table (as specified in section 3.1.1) that have this revisions UpdateID specified as a PrerequisiteUpdateID.
- **Xml:** The revision's associated "core" metadata (FragmentType = "Core").

Note: The server implementation MUST send no more than one revision for a given Update. It is recommended that the implementation SHOULD, in the event of multiple matches, select only the latest revision (the one with the highest revision number).

- **SyncUpdatesResponse.OutOfScopeRevisionIDs:** Populated with the IDs of revision that are in the CachedRevisions list that are not in the NeededRevisions list.
- **SyncUpdatesResponse.ChangedUpdates:** Populated with entries for revisions in the NeededRevisions list that are also in the CachedRevisions list, but for which Deployment or IsLeaf data has changed since the last time the client synchronized with the server. The fields of these entries are populated according to the server's abstract data model (as specified in section 3.1.1) as follows:
 - **Deployment:** The entry in the deployment table that specifies how the revision is deployed to the client's target group.
 - **IsLeaf:** The entry in the Revision table that specifies whether the revision is a leaf in the prerequisite graph.
 - **SyncUpdatesResponse.Truncated:** The server MAY choose to return a subset of the updates that would normally be returned in the <NewUpdates> collection, in order to reduce the processing overhead incurred by a single call to the server. In such cases, the server MUST set Truncated = true.<42>
 - **SyncUpdatesResponse.NewCookie:** The server MUST return a new cookie for the client to use on subsequent SyncUpdates calls. The server SHOULD update the cookie with the highest (most recent) LastChangeTime stored in the deployment table. This allows the server to determine, on future calls to SyncUpdates, if a revision that stays in scope for the client needs to have its deployment returned in the ChangedUpdates list; if the current deployment's LastChangeTime is less than the value stored in this cookie, then the deployment need not be returned in the ChannelUpdates list, since the deployment data will already be cached on the client.

3.1.5.8 RefreshCache

Synopsis:

This method is called by the client to refresh the revision IDs it uses to reference its cache revisions when it initiates synchronization with a new server.

This protocol uses revision IDs to identify revisions. Because revision IDs are generated by each server, the client MUST invoked this method to update the revision ID identifiers for each revision in its cache whenever it changes servers. This method MUST only be called by the client in response to the server throwing a ServerChanged or InvalidCookie ErrorCode and it MUST be called in the sequence specified for the error in section 2.2.2.4.

Request Validation:

Parameter	Validation conditions	Error code
cookie	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
globalIDs	MUST be present.	InvalidParameters

Results:

If no faults occur during the operation, the server MUST return a RefreshCacheResponse message to the client.

The response consists of an array of **RefreshCacheResult** elements. There MUST be one element for each *GlobalID* parameter for which an entry exists in the deployment table from that update to the client's target group. Each such element MUST contain:

RevisionID: The revision ID referenced by the entry in the deployment.

GlobalID: The *GlobalID* parameter.

IsLeaf: The **IsLeaf** element in the revision table referenced by the revision ID.

Deployment: The entry in the deployment table that specifies the revision ID and the client's TargetGroupName.

3.1.5.9 GetExtendedUpdateInfo

Synopsis:

To optimize client/server communications, the SyncUpdates (section 3.1.5.7) method only downloads the "Core" metadata associated with an update revision. Additional metadata and the URLs of the revision content MUST be obtained by using this method.

Request Validation:

Parameter	Validation Conditions	Error Code
<i>cookie</i>	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
<i>revisionIDs</i>	MUST be smaller than the maximum request value that the server specified in the return value of GetConfig().	InvalidParameter
<i>infoTypes</i>	MUST be present.	InvalidParameters
<i>locales</i>	MUST be present, if the <i>infoTypes</i> parameter contains either the Eula or the LocalizedProperties element.	InvalidParameters

Response:

Upon successful completion, the server MUST return a GetExtendedUpdateInfoResponse message to the client. The message MUST be composed as follows:

- **OutOfScopeRevisionIDs:** The IDs of requested revisions that are not deployed to the client.
- **Updates:** Metadata fragments associated with the requested revision that match one of the requested *infoTypes*.

- **FileLocations:** For each requested revision that is deployed to the client, the URLs (in the update content directory) of the updates-associated content. The structure of the content directory is implementation-specific. <43>

3.1.5.10 GetFileLocations

Synopsis:

This method is called when the client needs to update its cached FileLocation information. A client MUST invoke this method when another method returns a FileLocationsChanged ErrorCode. A client MAY invoke GetFileLocations at other times when it has a valid *cookie* and a valid list of *fileDigests*.

Request Validation:

Parameter	Validation Conditions	Error Code
<i>cookie</i>	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
<i>fileDigests</i>	MUST be present. Each element within this array MUST be 20 bytes in length.	InvalidParameters

Response:

Upon successful completion, the server MUST return a GetFileLocationsResponse message to the client. The message MUST include file locations for content matching the specified SHA1 hashes, although the file location itself is implementation-specific. <44>

3.1.5.11 ReportEventBatch

Synopsis:

This web method is invoked by clients to report events to the server.

Request Validation:

Parameter	Validation Conditions	Error Code
<i>cookie</i>	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired
<i>clientTime</i>	MUST be present.	The server MAY return InvalidParameters
<i>eventBatch</i>	MUST be present.	The server MAY return InvalidParameters.

Data Processing:

All processing of reported events is implementation-specific.

Response:

If no faults occur during the operation, the server MUST return a ReportEventBatchResponse message to the client.

3.1.5.12 SyncPrinterCatalog

Synopsis:

This call supports the synchronization of printer driver update metadata to client computers (2) and is used only by the Add Printer Wizard on the client.

Request Validation:

Parameter	Validation conditions	Error code
cookie	MUST be a valid cookie, issued by this server, that has not expired.	InvalidCookie, ServerChanged, or CookieExpired

Data Processing:

The data processing specified in this section references most of the elements of the abstract data model, as specified in section 3.1.1.

The server MUST check whether the configuration data returned from GetConfig (section 3.1.5.2) has changed since the last time the client synchronized and, if so, throw a ConfigChanged ErrorCode fault.

The server SHOULD check whether client registration is required but the client is not yet registered. If so, it SHOULD throw a RegistrationRequired ErrorCode.

The next step is for the server to compute the NeededRevisions list for the client. The server MUST do so as follows:

1. Restrict the set of revisions to those that are deployed to the client computer's target group, combined with any dependencies (prerequisite or bundle) of such updates.
2. Restrict the resulting set further to those revisions whose prerequisites are satisfied by the updates whose revision IDs are specified in Parameters.InstalledNonLeafUpdateIDs.
3. Restrict the resulting set further to either:
 - Revisions for which all the following conditions hold:
 - UpdateType = Driver
 - DriverClass = Printer
 - If there is already a driver installed on the device:
 - The revision has an entry in the driver table that MUST be a "better" match than the installed driver.
 - The revision MUST have an entry in the driver table that matches the Provider and Manufacturer for the installed driver.

Next, the server MUST generate the list of CachedRevisions by accepting the revisions listed in Parameters.CachedDriverIDs.

Results:

If no faults occur during the operation, the server MUST return a SyncPrinterCatalogResponse message to the client. It MUST generate the response as follows:

- **SyncPrinterCatalogResponse.NewUpdates:** Populated with entries for revision in the NeededRevisions list that are not in the CachedRevisions list:
 - **ID:** The revision ID.
 - **Deployment:** Information about the deployment to this revision. If this revision was not explicitly deployed to the client by an administrator (for example, it was included in the

NeededRevisions list because it was a dependency of an explicitly deployed revision), the DeploymentAction MUST be set to "Evaluate". For driver updates (UpdateType = driver), when the client reports a protocolVersion of "1.6" or higher in the GetCookie call, the server SHOULD include all the HardwareIDs that are selected as "best" matches associated with this revision from the driver table.<45>

- **IsLeaf:** Specifies whether the revision is a leaf on the prerequisite graph. That is, no entries in the abstract data model prerequisite table (as specified in section 3.1.1) have this revision's UpdateID specified as a PrerequisiteUpdateID.
- **Xml:** The "core" metadata (FragmentType = "Core") associated with the revision.

Note: The server implementation MUST send no more than one revision for a given Update. It is recommended that the implementation SHOULD, in the event of multiple matches, select only the latest revision (the one with the highest revision number).

- **SyncPrinterCatalogResponse.OutOfScopeRevisionIDs:** Populated with the revision's IDs in the CachedRevisions list that are not in the NeededRevisions list.
- **SyncPrinterCatalogResponse.ChangedUpdates:** Populated with entries for revisions in the NeededRevisions list that are also in the CachedRevisions list, but for which Deployment or IsLeaf data has changed since the last time the client synchronized with the server. The fields of these entries are populated according to the server's abstract data model (as specified in section 3.1.1) as follows:
 - **Deployment:** The entry in the deployment table that specifies how the revision is deployed to the client's target group.
 - **IsLeaf:** The entry in the Revision table that specifies whether the revision is a leaf in the prerequisite graph.
 - **SyncPrinterCatalogResponse.Truncated:** The server MAY choose to return a subset of the updates that would normally be returned in the <NewUpdates> collection to reduce the processing overhead incurred by a single call to the server. In such cases, the server MUST set Truncated = TRUE.<46>
- **SyncPrinterCatalogResponse.NewCookie:** The server MUST return a new cookie for the client to use on subsequent SyncUpdates calls. The server SHOULD update the cookie with the highest (most recent) LastChangeTime stored in the deployment table. This allows the server to determine, on future calls to SyncUpdates, whether a revision that stays in scope for the client needs to have its deployment returned in the ChangedUpdates list; if the current deployment's LastChangeTime is less than the value stored in this cookie, then the deployment need not be returned in the ChannelUpdates list, because the deployment data will already be cached on the client.

3.1.6 Timer Events

None.

3.1.7 Other Local Events

None.

3.2 Client Details

This section describes the logical structure, components, and event handlers of this protocol.

3.2.1 Abstract Data Model

This section describes a conceptual model and possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as the external behavior is consistent with that described in this document.

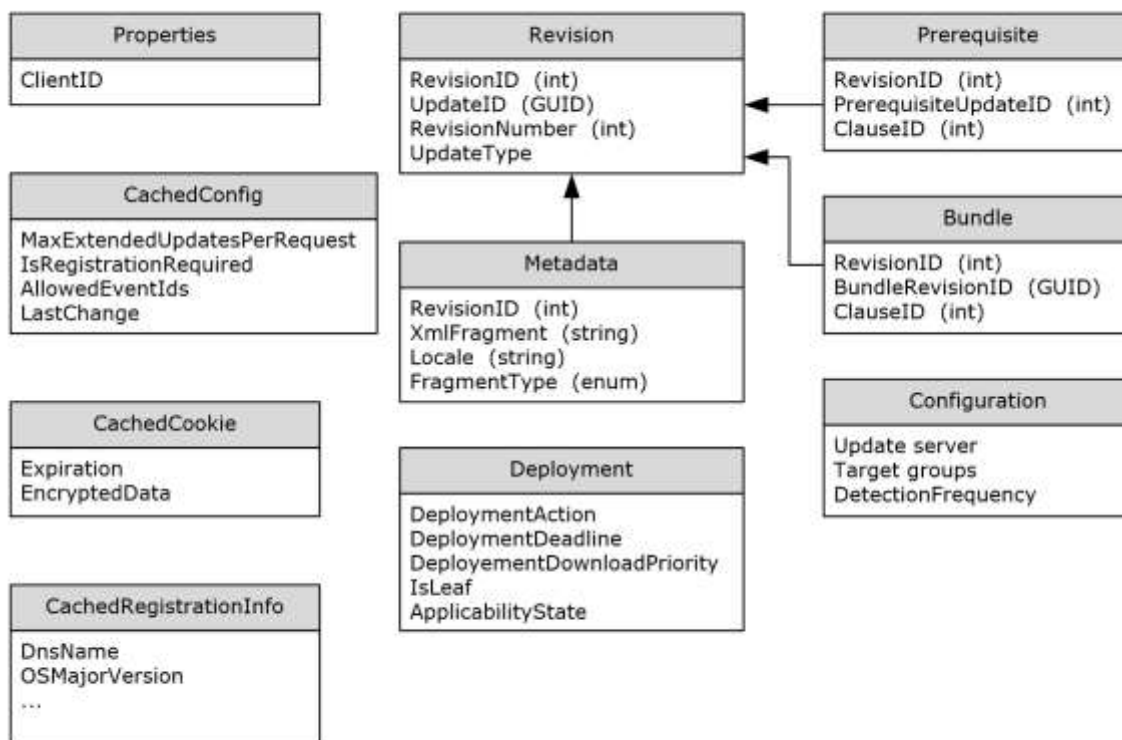

Figure 4: Client abstract data model

Prerequisite table: Has the same definition as specified in section 3.1.1.

Bundle table: Has the same definition as specified in section 3.1.1.

Metadata table: Has the same definition as specified in section 3.1.1.

Deployment table: Has the same definition as specified in section 3.1.1, but adds the following additional elements:

DeploymentAction: Has the same definition as the Deployment table's Action element as specified in section 3.1.1.

DeploymentDeadline: Has the same definition as the Deployment table's Deadline element as specified in section 3.1.1.

DeploymentDownloadPriority: Has the same definition as the Deployment table's DownloadPriority element as specified in section 3.1.1.

IsLeaf: Specifies whether this revision is a leaf in the server's prerequisite graph. This value is returned to the client in the SyncUpdates (section 3.1.5.7) method.

ApplicabilityState: The client evaluates whether the revision is needed, installed, or not applicable during metadata synchronization. The client does this by evaluating the applicability rules in the core metadata fragment (although the format of the applicability rules is opaque to the client-server protocol). The client obtains the core revision metadata from the server's SyncUpdates (section 3.1.5.7) method. The client reevaluates the applicability state of all revisions before each sync. The applicability state of the revisions affects how the client passes the parameters to the SyncUpdates (section 3.1.5.7) method.

Revision Table: A collection of entries corresponding to the revisions available on the server. Each entry is uniquely identified by an update ID and revision's number, and is also independently uniquely identified by a revision ID. Each entry includes the following elements:

RevisionID: A server-assigned revision identifier. Because it is more compact than the globally unique (UpdateID, RevisionNumber) pair, the RevisionID is used as the revision identifier during client-server communications in order to minimize network traffic.

UpdateID: A globally unique identifier (GUID) that is the same for all revisions of an update.

RevisionNumber: Used in conjunction with the UpdateID to uniquely identify the revision.

UpdateType: Specifies whether the update is a Driver, Software, Category, or Detectoid. The SyncUpdates (section 3.1.5.7) method treats drivers and non-drivers differently as specified in section 3.1.5.7.

Properties Table: Persistently stored properties used by the client. There is exactly one entry, which includes the following element.

ClientID: A ClientIdString that the client generates to uniquely identify itself to the server.

CachedConfig table: The client caches the return value from GetConfig (section 3.1.5.2) so that it can avoid calling this method on every sync. The **GetConfigResult** structure (section 2.2.2.2.1) describes the individual elements.

CachedCookie table: The cookie returned from GetCookie (section 3.1.5.4), SyncUpdates (section 3.1.5.7), or GetFileLocations (section 3.1.5.10). There is at most one entry, which includes the following elements:

Expiration: A clear-text copy of the time the cookie expires.

EncryptedData: An opaque sequence of one or more bytes containing server-implementation-specific authorization, authentication, and protocol state information.

CachedRegistrationInfo Table: The last set of parameters passed to the server's RegisterComputer (section 3.1.5.5) method. There is at most one entry, which includes one element for each parameter passed to the RegisterComputer method. The complete list of parameters are described as part of the **computerInfo** structure which is specified in section 2.2.2.2.3

Configuration Table: A set of properties that configure client behavior. Storage of these properties is implementation-dependent. There is exactly one entry, which includes the following elements:

Update server: The server against which this protocol is performed.

Target groups: Unordered set of target groups to which the client belongs. When calling **GetAuthorizationCookie**, the client SHOULD read this value from its configuration store and use it to populate the *targetGroupName* parameter.

DetectionFrequency: If the client automatically performs periodic protocol exchanges, this is the interval in hours for which the client waits between such exchanges.

3.2.2 Timers

If the client automatically performs periodic protocol exchanges on the interval defined by the **DetectionFrequency** setting of the **Configuration Table** ADM element, it SHOULD use a timer for the next protocol exchange time.<48>

All other timers are implementation-specific.<49>

3.2.3 Initialization

On its first initialization, each client MUST assign itself a ClientIdString. The resulting value MUST be stored as the ClientID property in a persistent storage location for use in subsequent protocol operations. The algorithm used by the client to create the ClientID is implementation-specific.<50>

Before initiating any protocol communication with a server, the client SHOULD read the **Update Server** element of the **Configuration Table** to determine the server to communicate with.

3.2.4 Higher-Layer Triggered Events

The only higher-layer triggered events required by the protocol are the generation of the reporting events as specified in the EventID table of ReportEventBatch (section 2.2.2.3.1). The client SHOULD send these events up after a small random delay in order to allow events to be batched together, which improves network, client, and server performance.<51>

Other higher-layer triggers are up to the implementation.

3.2.5 Message Processing Events and Sequencing Rules

The "metadata sync" portion of this protocol conforms to the figure as specified in section 3.1.5.

Self-update, authorization, and metadata sync MUST be performed in the sequence shown in the figure as specified in section 3.1.5, although, as an optimization, certain steps MAY be omitted under the conditions specified below. In particular, the client MAY perform the following optimizations.

- The result of GetConfig (section 3.1.5.2) SHOULD be cached on the client. Subsequent synchronizations MAY omit this method invocation unless the server throws a ConfigChanged ErrorCode.
- The cookie returned from GetCookie (section 3.1.5.4) or SyncUpdates (section 3.1.5.7) SHOULD be cached on the client. Subsequent synchronizations SHOULD omit the call to GetAuthorizationCookie (section 3.1.5.3) and GetCookie unless the server throws a CookieExpired ErrorCode, or unless the client determines that the clear-text copy of the cookie expiration time shows the cookie to be expired.
- The registration information sent to the server SHOULD be cached on the client.

Subsequent synchronizations SHOULD omit the call to RegisterComputer (section 3.1.5.5), unless the registration information has changed on the client, or unless the server throws a RegistrationRequired exception.

In addition to the standard sync path specified above, the client MUST also perform special recovery steps when the server returns certain application-level faults, as specified in section 2.2.2.4.

In addition to metadata sync, the client also initiates content download for applicable updates, installation of those updates after the download completes, and generation of events to report to the server. It is implementation-specific as to when these are performed. Content is downloaded using HTTP (as specified in [RFC2616]). Optionally, content can be downloaded using HTTP in a restartable (progressive) manner using the BITS Upload Protocol [MC-BUP].

3.2.6 Timer Events

There are no timer events required by this protocol.<52>

3.2.7 Other Local Events

If, at the start of metadata synchronization, the client determines that the registration information it last sent to the server has changed, it SHOULD call the RegisterComputer (section 3.1.5.5) method during metadata synchronization, as specified in section 3.1.5.5.

5 Security

5.1 Security Considerations

Because the server can tell the client to install binaries, it is important to prevent a man-in-the-middle or other forms of a spoof server telling the client to install binaries that will compromise the client computer (1). For this reason, it is recommended that the client perform several checks:

- Only accept content signed by trusted certificates. The set of certificates to be considered trusted is implementation-specific.<53>
- Only accept content whose SHA1 hash matches the SHA1 hash specified in the metadata.

As a result, it is strongly recommended that the server be configured so that all metadata communication is done over a Secure Sockets Layer (SSL) port. Using SSL ensures that the client is communicating with the real server and so prevents a spoof server from sending the client harmful requests (for example, to uninstall patches). If the server allows downloading content via SSL, then additional checks are performed on the certificates to verify trust and confirm authenticity of the content.<54>

Because the WSUS server distributes publicly available patches (from Microsoft Update), client authentication is not a particularly important security consideration. In fact, supporting unauthenticated clients is probably the best approach because in most environments, it is more important to keep all machines patched than it is to deny access to unauthenticated clients.

There are two strategies one can use to reduce the impact of denial-of-service (DOS) attacks against the server:

- Turn on authentication and deny access to unauthenticated clients. This will allow one to quickly disable access to rogue client machines. The downside of this approach, discussed in the section above, is that it means new clients might not get patched by default.
- Make sure no single operation takes too much processing time on the server. That will ensure that any attacker keeps up a steady stream of requests to deny access to the server, and so a simple network trace will allow one to identify the offending machine and shut it down. This applies to requests sent by "spoof clients" (for example, a virus emulating a client, which might try to pass an unbounded set of parameters to various methods).

If the server implementation stores and displays any data passed to it from clients (for example, DnsName or BiosName), it is important to ensure that the data is not malformed—especially if it is displayed in the context of a scripting language (for example, from JScript from within a webpage).

6 Appendix A: Full WSDL Definitions

For ease of implementation, this section provides the full WSDL.

6.1 SimpleAuth Web Service WSDL

7 (Updated Section) Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include updates to those products.

The terms "earlier" and "later", when used with a product version, refer to either all preceding versions or all subsequent versions, respectively. The term "through" refers to the inclusive range of versions. Applicable Microsoft products are listed chronologically in this section.

Windows Client

- Windows 2000 Professional operating system Service Pack 3 (SP3)
- Windows XP operating system
- Windows Vista operating system
- Windows 7 operating system
- Windows 8 operating system
- Windows 8.1 operating system
- Windows 10 operating system

Windows Server

- Windows 2000 Server operating system
- Windows Server 2003 operating system
- Windows Server 2008 operating system
- Windows Server 2008 R2 operating system
- Windows Server 2012 operating system
- Windows Server 2012 R2 operating system
- Windows Server 2016 operating system
- Windows Server operating system
- Windows Server 2019 operating system

- Windows Server 2022 operating system

Exceptions, if any, are noted in this section. If an update version, service pack or Knowledge Base (KB) number appears with a product name, the behavior changed in that update. The new behavior also applies to subsequent updates unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms "SHOULD" or "SHOULD NOT" implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term "MAY" implies that the product does not follow the prescription.

<1> Section 1.3: **WSUS** is a component of Windows that consists of both an update client implementation and an update server implementation.

The update server is a component of some Windows versions and can be installed to enable applicable Windows Server releases to operate as update servers. The following table lists the Windows versions supported by each version of the update server.

	WSUS 2.0 update server	WSUS 2.0 SP1 update server	WSUS 3.0 update server	WSUS 3.0 SP1 update server	WSUS 3.0 SP2 update server
Windows 2000 Server	Supported	Supported	Not supported	Not supported	Not supported
Windows Server 2003	Supported	Supported	Supported	Supported	Supported
Windows Server 2008	Not supported	Not supported	Not supported	Supported	Supported
Windows Server 2008 R2	Not supported	Not supported	Not supported	Not supported	Supported
Windows Server 2012	Not supported	Not supported	Not supported	Not supported	Supported
Windows Server 2012 R2 operating system	Not supported	Not supported	Not supported	Not supported	Supported
Windows Server 2016	Not supported	Not supported	Not supported	Not supported	Supported

The update client is a component of some Windows versions. The following table describes the Windows versions supported by each version of the update client.

	WSUS 2.0 update client	WSUS 2.0 SP1 update client	WSUS 3.0 update client	WSUS 3.0 SP1 update client	WSUS 3.0 SP2 update client
Windows 2000 operating system	Supported	Supported	Supported	Supported	Supported
Windows XP	Supported	Supported	Supported	Supported	Supported
Windows Vista	Not supported	Not supported	Supported	Supported	Supported
Windows 7	Not supported	Not supported	Not supported	Not supported	Supported
Windows 8	Not supported	Not supported	Not supported	Not supported	Supported
Windows 8.1	Not supported	Not supported	Not supported	Not supported	Supported
Windows 10	Not supported	Not supported	Not supported	Not supported	Supported

<2> Section 2: Self-updating functionality is available only in Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1.

<3> Section 2.1: This protocol supports HTTPS for securing its ports, although SSL is not configured by default when the Server-Server Protocol [MS-WSUSSS] is installed.

<4> Section 2.1: Self-updating functionality is available only in Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1.

<5> Section 2.1: This protocol exposes the self-update content directory on port 80. It has a setup-time configuration option to expose a non-SSL contentPort on either port 80 or port 8530. For non-SSL configurations, this protocol uses the contentPort as the commonPort. For SSL configurations, this protocol uses port 443 for the commonPort if the content port is 80, or port N+1 for the commonPort if the content port is any other port. So, if the contentPort is 8530, the commonPort can be either 8530 (non-SSL) or 8531 (SSL) [MS-WSUSSS].

<6> Section 2.1: Self-updating functionality is available only in Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1.

<7> Section 2.1: The WSUS server exposes the self-update content directory on port 80 to support the WUA on Windows 2000 Professional SP3, which implements client protocol version 0.9.

<8> Section 2.1.1: Windows uses a block size of 65535 bytes.

<9> Section 2.2: In this specification, excerpts are given from the WSDL file for the Windows implementation of this protocol. In the WSDL file, the attributes **minOccurs** and **maxOccurs** denote the number of elements allowed, so that zero is $\leq \text{minOccurs} \leq \text{maxOccurs}$, as specified in [WSDL].

<10> Section 2.2.1: The following table shows the Microsoft-defined XML namespaces used within this protocol and the alias (prefix) used in the remaining sections of this specification.

Alias (Prefix)	XML Namespace
s2	http://microsoft.com/wsdl/types/
s1	The target namespace. The XML namespace it refers to depends on the WSDL file it is used in. For SimpleAuth Web Service WSDL, it is http://www.microsoft.com/SoftwareDistribution/Server/SimpleAuthWebService. For the client Web service WSDL, it is http://www.microsoft.com/SoftwareDistribution/Server/ClientWebService. For Reporting Web Service WSDL, it is http://www.microsoft.com/SoftwareDistribution

<11> Section 2.2.2.2.1: The following table shows the client protocol version used by various versions of the WSUS update client.

WSUS update client	Client protocol version
WSUS 2.0	1.0
WSUS 2.0 SP1	1.0
WSUS 3.0	1.0
WSUS 3.0 SP1	1.6
WSUS 3.0 SP2	1.8

Client protocol versions greater than 1.8 are as follows. They are updated by servicing updates and will interoperate with any version of the WSUS update client.

Windows version	Client protocol version
Windows 10 v1809 operating system	1.9
Windows 10 v1903 operating system	2.0

Windows version	Client protocol version
Windows 10 v2004 operating system	2.3
Windows 10 v20H2 operating system	2.4

<12> Section 2.2.2.2.1: The following table shows the server protocol version returned by various versions of the WSUS update server.

WSUS update server	Server protocol version
WSUS 2.0	Not returned
WSUS 2.0 SP1	Not returned
WSUS 3.0	3.0
WSUS 3.0 SP1	3.1
WSUS 3.0 SP2	3.2

<13> Section 2.2.2.2.3: The following table details how the WSUS server determines the name of the client's operating system. An empty cell means that the WSUS server assumes that the name of the client operating system is the one specified in the first column if the values in the other columns match. All string comparisons are case-insensitive. For example, the following are all treated the same: AMD64, amd64, and Amd64. If multiple rows of the table match, the WSUS server uses the name in the row that appears first.

Name of client operating system	OS major version	OS minor version	Suite mask	Old product type	New product type	System metrics	Processor architecture
Windows Server 2019	10	0					
Windows 10	10	0					
Windows Server 2016	10	0

<14> Section 2.2.2.2.3: The elements OSDescription, OEM, DeviceType, FirmwareVersion, and MobileOperator are not available on Windows 2000 Server, Windows 2000 Professional SP3, Windows XP, Windows Server 2003, Windows Vista, Windows Server 2008, Windows 7, Windows Server 2008 R2, Windows 8, Windows Server 2012, Windows 8.1, and Windows Server 2012 R2.

<15> Section 2.2.2.2.4: ComputerSpec and FeatureScoreMatchingKey are not available on Windows 2000 Professional SP3, Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1.

<16> Section 2.2.2.2.4: MatchingComputerHWID and DriverRank elements are not available on Windows 2000 Professional SP3, Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1.

<17> Section 2.2.2.2.4: extensionDrivers are not supported in clients earlier than Windows 10 v1709 operating system.

<18> Section 2.2.2.2.4: DriverRecoveryID is not supported in clients earlier than Windows 10 v1809.

<19> Section 2.2.2.2.4: The ClientBehaviors element is not supported in Windows clients earlier than Windows 10 v21H1 operating system.

<20> Section 2.2.2.2.4: OptionalInstall is not supported in clients earlier than Windows 10 v1903.

<21> Section 2.2.2.2.4: WSUS 3.0 ~~Service Pack 1~~SP1 and higher includes WSUS 3.0 SP2 include this element when the deployment is associated with a driver update and the protocolVersion reported by the client in the GetCookie call is "1.6" or higher. WSUS 2.0 and WSUS 3.0 RTM versions of the server do not include this in the response.

<22> Section 2.2.2.2.6: In Windows 8 and later and Windows Server 2012 and later, WUA performs an additional security check on downloaded payload files. These versions of WUA require the update's extended metadata XML fragment to contain a Files element using the following schema.

```

<simpleType name="FileDigestAlgorithm">
  <annotation>
    <documentation>A cryptography algorithm supported by MSUS that is used to produce FileDigest
    values.</documentation>
  </annotation>
  <restriction base="token">
    <enumeration value="SHA1" />
  </restriction>
</simpleType>
<simpleType name="AdditionalDigestAlgorithm">
  <annotation>

```

WUA finds the **Files/File** element whose Digest attribute matches the FileDigest of the content file being downloaded. It then finds the **AdditionalDigest** element whose Algorithm attribute is equal to SHA256. It takes the contents of that **AdditionalDigest** element, compares it to the calculated SHA-256 hash **value** of the downloaded content file, and rejects the content file if the two hashes do not match (or if the update metadata does not contain the additional digest information).

<23> Section 2.2.2.2.10: The GetExtendedUpdateInfo2 is not available in Windows 2000 Server, Windows 2000 Professional SP3, Windows XP, Windows Server 2003, Windows Vista, Windows Server 2008, and Windows Server 2008 R2.

<24> Section 2.2.2.2.10: In Windows 8 and later and Windows Server 2012 and later, WUA performs an additional security check on downloaded payload files. These versions of WUA require the update's extended metadata XML fragment to contain a Files element using the following schema.

```

<simpleType name="FileDigestAlgorithm">

WUA finds the **Files/File** element whose Digest attribute matches the FileDigest of the content file being downloaded. It then finds the **AdditionalDigest** element whose Algorithm attribute is equal to SHA256. It takes the contents of that **AdditionalDigest** element, compares it to the calculated SHA-256 hash **value** of the downloaded content file, and rejects the content file if the two hashes do not match (or if the update metadata does not contain the additional digest information).

<25> Section 2.2.2.3.1: For the tags used by WUA, see the MiscData table in section 2.2.2.3.1.

<26> Section 2.2.2.3.1: The Windows Update Agent (WUA) uses Windows system APIs to determine the values returned. The following table shows the values of "Major", "Minor", and "Build" generated by the WUA on various versions of Windows. The values of "Build", "Revision", "ServicePackMajor", and "ServicePackMinor" vary depending on the updates and service packs installed.

This table also includes the OSProductType ('c') value returned in the MiscData structure for applicable Windows Server releases whose OSProductType is documented as "2 or 3". The WUA returns 2 if the system is configured to act as a domain controller and 3 otherwise.

Windows version	Major	Minor	OSProductType
Windows Server 2019	10	0	2 or 3
Windows 10	10	0	1
Windows Server 2016	10	0	2 or 3
Windows 8.1	6	3	1
Windows Server 2012 R2	6	3	2 or 3
Windows 8	6	2	1
Windows Server 2012	6	2	2 or 3
Windows 7	6	1	1
Windows Server 2008 R2 operating system	6	1	2 or 3
Windows Server 2008	6	0	2 or 3
Windows Vista	6	0	1
Windows Server 2003 R2	5	2	Not returned
Windows Home Server server software	5	2	Not returned
Windows Server 2003	5	2	Not returned
Windows XP Professional x64 Edition	5	2	Not returned
Windows XP	5	1	Not returned
Windows 2000	5	0	Not returned

<27> Section 2.2.2.3.1: Self-updating functionality is available only in Windows XP, Windows Vista, Windows 7, Windows 8, and Windows 8.1 operating system.

<28> Section 2.2.2.3.1: See the product behavior note for **OSVersion** earlier in this section.

<29> Section 3.1.1.1: On an AMD64 architecture machine running Windows 10, this would be "amd64.10.0".

<30> Section 3.1.1.1: Windows uses the following schemas to describe the applicability of Windows Updates. The WUA uses Windows APIs to process the rules.

BaseApplicabilityRules Schema

```
<?xml version="1.0" encoding="UTF-8"?>

as the currently installed driver.</documentation>
</annotation>
<complexType />
</element>
</schema>

```

<31> Section 3.1.1.1: WUA expects the /Update/LocalizedPropertiesCollection/EulaFile node to conform to the following schema.

```

<complexType name="EulaFile">
  <annotation>
    <documentation>A localized end user license agreement (EULA) file for the update.
The MSUS Client will download the EULA to the local hard drive and validate
Digest.</documentation>
  </annotation>
  <!-- The following sequence is expected only by Windows 8 and Windows Server 2012 -->
  <sequence>
    <element name="AdditionalDigest" minOccurs="0" maxOccurs="unbounded"
type="bt:AdditionalDigest"></element>
  </sequence>
  <attribute name="Digest" type="bt:FileDigest" use="required" />
  <attribute name="DigestAlgorithm" type="bt:FileDigestAlgorithm" use="required" />
  <attribute name="FileName" type="bt:FileName" use="required" />
  <attribute name="Size" type="bt:FileSize" use="required" />
  <attribute name="Language" type="upd:LocalizedPropertiesLanguage" use="required" />
</complexType>

```

WUA uses the Digest attribute both to obtain the download URL for the EULA file (using the GetFileLocations method) and to verify the authenticity of the EULA file downloaded from the server. WUA calculates the SHA-1 hash **value** of the downloaded EULA file and compares it to the SHA-1 hash **value** contained in the Digest attribute; if the two hashes do not match, WUA discards the file.

In Windows 8 and later and Windows Server 2012 and later, WUA performs an additional security check on downloaded EULA files. WUA will find the **AdditionalDigest** element whose Algorithm attribute is equal to "SHA256". It will take the contents of that **AdditionalDigest** element, compare it to the calculated SHA-256 hash **value** of the downloaded EULA file, and reject the content file if the two hashes do not match (or if the update metadata does not contain the additional digest information).

<32> Section 3.1.1.1: WSUS 2.0 populates table entries when the clients call the GetAuthorizationCookie (section 2.2.2.1.1) method.

<33> Section 3.1.1.1: WSUS populates table entries based on administrative configuration. The entries are never populated automatically by the server.

<34> Section 3.1.1.1: WSUS populates table entries based on administrative configuration. For more information, see [WSUS].

<35> Section 3.1.5.1: Only Windows 8.1 and earlier Windows versions use this self-update mechanism.

<36> Section 3.1.5.1: Windows 8.1 and earlier Windows versions perform self-update using the contents of the self-update content directory. Since these versions of Windows require that these files be Microsoft-signed, the files cannot be modified. For information on how to receive a redistributable copy of these files, contact dochelp@microsoft.com.

Windows 10 does not perform self-update and does not access the files in the self-update content directory.

For reference, here is a summary of how Windows 8.1 and earlier Windows versions perform self-update.

1. The client retrieves the file `wuident.cab` from the self-update content directory and verifies that it is signed by Microsoft. If the `wuident.cab` file is not present or is not signed by Microsoft, the client stops self-update and does not further interoperate with the server.
2. The client retrieves the file `wuident.txt` from the `wuident.cab` file.
3. The client compares the version number of the current version of the Windows Update client files to the versions listed in the [OS], [OS2], and [OS3] sections of the `wuident.txt` file, and finds the matching line in the file.
4. If the matching line in `wuident.txt` contains the directive `"/SKIP"`, then the client is already up-to-date and self-update is complete.
5. If the matching line in `wuident` contains the directive `"/UNSUPPORTED"`, then the client cannot self-update and does not further interoperate with the server.
6. If the matching line in `wuident` contains neither `"/SKIP"` nor `"/UNSUPPORTED"`, then it specifies a subdirectory.
7. The client compares the architecture of the current version of Windows to the list of architectures in the [ARCH] section of the `wuident.txt` file and retrieves a subdirectory name from the matching line.
8. The client compares the primary language of the current version of Windows to the list of languages in the [LANG] section of the `wuident.txt` file and retrieves a subdirectory name from the matching line.
9. The client assembles the full subdirectory path from the three subdirectory names it has retrieved, using the format specified in the `StructureKeyEx`, `StructureKeyEx2`, or `StructureKeyEx3` lines in the [SelfClientUpdate] section of the `wuident.txt` file.
10. The client accesses the resulting self-directory within the self-update content directory. This directory will contain a set of several files containing the appropriate Windows Update client binaries for the current version, architecture, and language of Windows.
11. The client verifies that these files are Microsoft-signed, unpacks the contents into a secure directory, and executes them to update the client binaries.
12. If the installation succeeds, then self-update is complete.
13. If the installation fails, then the client cannot self-update and does not further interoperate with the server.

<37> Section 3.1.5.3: WSUS returns `InternalServerError`

<38> Section 3.1.5.3: WSUS returns `InternalServerError`

<39> Section 3.1.5.6: WSUS 3.0 SP2 validates the number of categories to be less than 200. Otherwise, it returns an error code of `InvalidParameters`. The `StartCategoryScan` method is not supported on WSUS 2.0, WSUS 2.0 SP1, WSUS 3.0, or WSUS 3.0 SP1.

<40> Section 3.1.5.7: Windows uses the following schemas to describe the applicability of Windows Updates. The Windows Update Agent uses Windows system APIs to process the rules.

```

<41> Section 3.1.5.7: WSUS 3.0 ~~Service Pack 1 includes~~ **SP1 and WSUS 3.0 SP2 include** the HardwareIDs when the deployment is associated with a driver update and the protocolVersion reported by the client in the GetCookie call is "1.6~~."~~ **" or higher.**

<42> Section 3.1.5.7: WSUS truncates responses at 200 NewUpdates.

<43> Section 3.1.5.9: WSUS stores all content in a relative path on the update content directory based on the SHA1 hash of the content. The SHA1 hash of the content can be parsed from the metadata as specified in section 3.1.1. The SHA1 hash is converted to a Binhex string; the last two bytes of that string are used to specify the subdirectory, and the full string is used as the location of the file in the subdirectory.

<44> Section 3.1.5.10: WSUS stores all content in a relative path on the update content directory based on the SHA1 hash of the content. The SHA1 hash of the content can be parsed from the metadata as specified in section 3.1.1. The SHA1 hash is converted to a Binhex string; the last two bytes of that string are used to specify the subdirectory, and the full string is used as the location of the file in the subdirectory.

<45> Section 3.1.5.12: WSUS 3.0 ~~Service Pack 1 includes~~ **SP1 and WSUS 3.0 SP2 include** the HardwareIDs when the deployment is associated with a driver update and the protocolVersion reported by the client in the GetCookie call is "1.6~~."~~ **" or higher.**

<46> Section 3.1.5.12: WSUS truncates responses at 200 NewUpdates.

<47> Section 3.2.1: WUA uses Group Policy. For more information about configuring additional client behavior, see [AUPOLICY]. The policy settings that are relevant to this protocol are as follows.

- The value of the **Update server** element is provided by the CorpWUURL_Name Group Policy setting.
- The value of the **Target groups** element is provided by the TargetGroup_Name Group Policy setting.
- The value of the **DetectionFrequency** element is provided by the DetectionFrequencyEnabled and DetectionFrequency Group Policy settings. If the value of the DetectionFrequencyEnabled Group Policy setting is 1, then the interval, in hours, is set to the value of the DetectionFrequency Group Policy setting. Otherwise, the interval is set to 22 hours.

The mapping of these Group Policy settings to registry keys is given in the wuau.adm file, which is available from [GPADM].

<48> Section 3.2.2: WUA can set a timer to automatically perform a periodic metadata synchronization. The period of the timer is randomized. After each metadata synchronization, the time of the next synchronization is computed as follows.

- The maximum period, in hours, is set to the value of the DetectionFrequency ADM element.
- The time of the next automatic synchronization is then computed by randomly selecting a period that is at most the maximum period and at least 0.8 multiplied with the maximum period, added to the current time.

<49> Section 3.2.2: The Windows Update Agent (WUA) obtains its configuration by using Group Policy, as specified in [MS-GPOL]. For more information, see [AUPOLICY].

- Scheduled Install: Specifies whether the client initiates an install of downloaded software on a specified schedule. This option is enabled in the default configuration of the client on Windows XP operating system Service Pack 2 (SP2) and later and Windows Server 2003 and later. This option is disabled by default on Windows 2000 Professional SP3, Windows XP, and Windows XP operating system Service Pack 1 (SP1).

<50> Section 3.2.3: WUA uses a self-generated GUID as the client ID. It stores the GUID in the registry in HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\WindowsUpdate\SusClientId. It regenerates the GUID whenever the client joins an Active Directory domain or changes its domain membership.

<51> Section 3.2.4: The WUA uses a random delay of between 1 and 10 minutes before reporting an event batch.

<52> Section 3.2.6: WUA implements the following timer events.

- Reporting. When a reporting event is generated on the client, it is not sent to the server right away. Rather, it is added to an event queue and a timer is started. In a random time interval from 0 to 5 minutes, the client uploads all events in the queue in a batch. This allows the client to send events up in batches, which optimizes network bandwidth compared to sending all the events individually.
- Retry failed sync. If metadata synchronization fails for some reason, the client will retry in 5 hours.

<53> Section 5.1: WUA only accepts install binaries signed by Microsoft certificates.

<54> Section 5.1: WUA uses CAPI to perform certificate revocation checks to ensure that the certificates can be trusted. There are three revocation check methods: CRL (cert revocation list), CTL (cert trust list), and OCSP stapling.

- For servers that provide non-Microsoft rooted certificates, such as WSUS supporting SSL, CAPI uses the method based on the certificates it encounters. Typically, it is the CRL method, where the CRL URL is embedded onto the certificates.
- For servers that provide Microsoft rooted certificates, CAPI uses the disallow trust list (CTL) instead of the embedded CRL URLs. See [MSKB-2813430] for more information.

WUA ignores any "revocation server offline/unreachable error"; that is, CAPI cannot refresh the CRL/CTL cache. If the server is reachable, WUA will honor any revocation errors that occur and fail the operation if the certificate is found to be revoked.

8 Change Tracking

This section identifies changes that were made to this document since the last release. Changes are classified as Major, Minor, or None.

The revision class **Major** means that the technical content in the document was significantly revised. Major changes affect protocol interoperability or implementation. Examples of major changes are:

- A document revision that incorporates changes to interoperability requirements.
- A document revision that captures changes to protocol functionality.

The revision class **Minor** means that the meaning of the technical content was clarified. Minor changes do not affect protocol interoperability or implementation. Examples of minor changes are updates to clarify ambiguity at the sentence, paragraph, or table level.

The revision class **None** means that no new technical changes were introduced. Minor editorial and formatting changes may have been made, but the relevant technical content is identical to the last released version.

The changes made to this document are listed in the following table. For more information, please contact dohelp@microsoft.com.

Section	Description	Revision class
2.2.2.2.1 GetConfig	10797 : Changed format example "ArrayOfConfigurationProperties" to "ArrayOfConfigurationProperty" for consistency.	Minor
2.2.2.2.1 GetConfig	10904 : Added information about client versions greater than 1.8 to the behavior note.	Major
2.2.2.2.3 RegisterComputer	10904 : Added information about Windows Server 2019 values in the behavior note.	Major
2.2.2.2.4 SyncUpdates	10904 : Added information about client versions greater than 1.6, the extensionDrivers type, the DriverRecoveryID type and its array, and the OptionalInstall action.	Major
2.2.2.2.4 SyncUpdates	Updated section to add optional "ClientBehaviors" and "ArrayOfClientBehavior" elements for this release of Windows.	Major
2.2.2.2.6 GetExtendedUpdateInfo	10933 : Clarified the expected default locale for the returned metadata.	Major
2.2.2.3.1 ReportEventBatch	10904 : Added information about Windows Server 2019 values.	Major
3.1.5.7 SyncUpdates	10904 : Added information about client versions greater than 1.6.	Major
3.1.5.12 SyncPrinterCatalog	10904 : Added information about client versions greater than 1.6.	Major
6.2 Client Web Service WSDL	10904 : Update the WSDL for 'extensionDrivers' and 'DriverRecoveryIDs' types.	Major
6.2 Client Web Service WSDL	Updated section to add optional "ClientBehaviors" and "ArrayOfClientBehavior" elements for this release of Windows.	Major
